Attention: Mr Owen NG

Dear Sir

**Agreement No. CE 45/2008 (CE)
Liantang/Heung Yuen Wai Boundary Control Point and Associated Works
Independent Environmental Checker – Investigation
Quarterly Ecological Monitoring Report for Woodland Compensation Area
(Stage 2 Enhancement Planting) (No. 8) – December 2020 to February 2021**

With reference to the Quarterly Ecological Monitoring Report for Woodland Compensation Area (Stage 2 Enhancement Planting) No. 8 for December 2020 to February 2021 (Version 2) certified by the ET Leader and received by IEC on 19 March 2021, please note that we have no adverse comments on the captioned submission. We herewith verify the captioned submission in accordance with Section 8.3.2.2 of the EM&A Manual.

Thank you for your attention and please do not hesitate to contact the undersigned on tel. 3995-8120 or by email to antony.wong@smec.com; or our Mr Arthur CHIU on tel. 3995-8144 or by email to arthur.chiu@smec.com.

Yours faithfully

Antony WONG

1. INTRODUCTION

1.1 GENERAL

- 1.1.1 The “Liantang/Heung Yuen Wai Boundary Control Point and Associated Works Project” (hereinafter referred to as “the Project”) comprises a new Boundary Control Point (BCP) proposed at Liantang/Heung Yuen Wai (LT/HYW), its connecting road and other associated works; and the Environmental Impact Assessment (EIA) report (Register No.:AEIAR-161/2011) of the Project has identified that ~6.2ha of secondary woodlands will be directly lost due to the construction of the portals of tunnels and some sections of the connecting road. Subsequently, creation of a 18.6 ha compensatory woodland at Cheung Shan has been recommended in the EIA report to avoid residual ecological impacts from the Project.
- 1.1.2 Under the Environmental Permit (EP-404/2011/D), an updated Woodland Compensation Plan (WCP) detailed with the planting strategy and the subsequent maintenance and monitoring requirements of the compensatory woodland has been submitted and approved by the Authority in the 4th Quarter of 2015, and a revision of the updated WCP (i.e., WCP Revision 2) has been approved by EPD in 2017.
- 1.1.3 The woodland compensation include an initial planting phase and enhancement planting phase over a 6 years period on the grassland and shrubland at Cheung Shan, i.e., the “Woodland Compensatory Area” (WCA) as shown in the **Drawing No. 60212563/SK7037 of the WCP** and included here as **Appendix A**; and the planting works fall within the work scope of Contract No. CV/2013/08 Liantang/ Heung Yuen Wai Boundary Control Point Site Formation and Infrastructure Works - Contract 6.
- 1.1.4 In accordance with the EM&A’s requirements and the monitoring schedule stated in the approved WCP (ver. 2) of the Project, as well as the latest status of the planting work that have been undertaken with the WCA, the Stage 2 enhancement planting (Phase 1) work has already covered all the monitoring quadrats in August 2019, as such this submission presents the findings of the 8th vegetation monitoring of the enhancement planting phase and covers the Reporting Period from **December 2020 to February 2021**, so as to address the monitoring frequency specified in S.7.2 of the approved WCP, i.e., quarterly monitoring after the first year of enhancement planting work.
- 1.1.5 Furthermore, since the vegetation monitoring is continuous from those undertaken for the initial planting phase, as such the monitoring has also covered those species previously planted, and if necessary the evaluation of their survival rate will take into account the increased in density or coverage of woody plants and hence changes in micro-climate of the monitoring quadrats (such as the decreased light exposure from the canopy of young trees or other woody plant, or increased competition for light, space and nutrient from the increased density of woody vegetation).

2. MONITORING REQUIREMENTS

2.1 MONITORING PROGRAM OF THE INITIAL AND ENHANCEMENT PLANTING PHASES

2.1.1 According to the Section 6.5 of the WCP (ver. 2), the frequency of the monitoring is proposed to be bi-monthly during the first year of the initial planting and enhancement planting phase and should be reduced to quarterly from the second year.

2.1.2 Change of monitoring frequency if needed will be advised by the Project Ecologist of the ET and approved by Environmental Protection Department (EPD) and Agriculture, Fisheries and Conservation Department (AFCD) before implementation.

2.2 MONITORING METHODOLOGY

2.2.1 An inspection walk monitoring by means of “transect route” and “direct observation” has been undertaken within the WCP as such to provide an overview and observe the general condition of the WCA; After due considerations of the latest planting arrangement within the WCA, the potential trampling damage to the planted seedlings, as well as the limitations in visibility, site access and safety concern when undertaking the monitoring among the steep hillslope, the transect routes has been selected to cover all representative areas where planting has been undertaken within the WCA as far as practicable.

2.2.2 The transect routes are illustrated in **Appendix C**, and the following observations have been made during the inspection walk:

- Weather condition during the time of monitoring
- The general condition of the WCA, including any signs of anthropogenic or natural disturbance/events (such as landslide, lightning strikes, wildlife damage) that has affected the health condition of the planted seedlings, or regeneration or invasive of grassy or self-seeded weedy plants that would or have affected the establishment of the planted vegetation
- The general health condition of each planted species graded in “Good”, “Fair” or “Poor” with the following criteria:
 - i) Phenology – signs of any abnormality in the phenology of the species (such as abnormal flowering/fruitletting/ leaf shedding)
 - ii) Foliage – colour, size and general appearance, signs and severity of insect and fungal infection
 - iii) Branches – presence and extent of die-back, and signs and severity of insect and fungal infection
 - iv) Stem/Trunk - signs and severity of cavities or internal/external decay; signs and severity of insect infection and mechanical damage

2.2.3 Since the monitoring approach adopted for the transect inspection, i.e., “*direct observations*”, would not yield any quantitative information, the survival rate (%) of the planted seedling will be evaluated from the results collected from the quadrat sampling as detailed in next section.

2.3 QUADRAT SAMPLING

2.3.1 A sampling approach has been proposed in the WCP to monitor the survival rate of the planted seedlings by the use of nine 20mx20m quadrats which are to be evenly located within the planted area of the WCA. Based on the as-built planting plan provided by the contractor (see **Appendix B**), as well as the local topography of the planted area within the WCA, the practicality in accessing, placing and monitoring nine 20m x 20m fixed quadrats within the planted area of the WCA has been extensively reviewed, 2 of the monitoring quadrats are fixed on the ridgeline of Cheung Shan and 7 of them are located on the north-facing slope of the WCA (see **Appendix C**).

- 2.3.2 Information collected within each sampling unit include:
- General condition of the sampling quadrat especially those factors that would or have found affected the survival rate of the planted vegetation, including biological or environmental factors (such as inter-specific competition as well as signs of stress from water, heat, or pest and disease, etc)
 - The total number of established seedlings for each planted tree and shrub species
 - Health condition of each planted species graded in “Good”, “Fair” or “Poor” with the following criteria:
 - i) Phenology – signs of any abnormality in the phenology of the species (such as abnormal flowering/fruitletting/ leaf shedding)
 - ii) Foliage – colour, size and general appearance, signs and severity of insect and fungal infection
 - iii) Branches – presence and extent of die-back, and signs and severity of insect and fungal infection
 - iv) Stem/Trunk - signs and severity of cavities or internal/external decay; signs and severity of insect infection and mechanical damage

2.3.3 The survival rate of the planted species during the initial planting phase and enhancement planting phase will be evaluated against the latest updated referenced baseline as shown in the **Table 3** below, if needed the implementation of the measures as detailed in the “Trigger and Action Levels” specified in the **Table 3** of the WCP would be recommended (included here as **Table 1** below).

Table 1 Trigger and Action Levels for Monitoring and Action Plan

Parameters	Trigger and Action Level	Action Plan
General Health Condition of planted species (i.e. good/fair/poor; based on parameters e.g. wilting, insect attack, disease, fungal infection, browsing damage)	Trigger Level: % of individual plant species in poor health condition >20%	- the ET should inform Contractor and IEC immediately; - identify the causes(s) of the exceedance; - advise Contractor the necessity of replanting
	Action Level: % of individual plant species in poor health condition >30%	- the ET should inform Contractor and IEC immediately; - identify the cause(s) of the exceedance; - advise remedial action and work out solution including change of species in re-planting, re-soiling of the target areas; and seek acceptance from AFCD; - once the remedial action has been accepted by AFCD, the Contractor should implement the remedial action.
Survival of Planted Species (i.e. dead)	Trigger Level: Survival rate of individual plant species <80%	- the ET should inform Contractor and IEC immediately; - identify the causes(s) of the exceedance; - advise Contractor the necessity of replanting.

	Action Level: Survival rate of individual plant species <70%	<ul style="list-style-type: none"> - the ET should inform Contractor and IEC immediately; - identify the cause(s) of the exceedance; - advise remedial action and work out solution including change of species in re-planting, re-soiling of the target areas; and seek acceptance from AFCD; - once the remedial action has been accepted by AFCD, the Contractor should implement the remedial action.
--	---	---

2.3.4 Since most of the planted native species are also naturally grown within the WCA and it would be infeasible and impracticable to differentiate whether the individual plant encountered along the transect or within the quadrat is planted, natural recruited, or regenerated after the pre-planting clearance of the site; and hence all established individuals of the planted species found within the sampling unit has been counted during the monitoring.

2.3.5 The WCA monitoring was undertaken by the Environmental Team (ET) and under the supervision of the Qualified Ecologist of the ET, and the Qualified Ecologist has also undertaken a joint transect inspection with representative of the IEC in the reporting.

2.4 REPORTING

Bi-monthly Woodland Compensation Monitoring Reports

2.4.1 The results and findings of the bi-monthly (i.e., once every two months) monitoring including the landscape inspection during the first year of the initial planting phase and the first year of the enhancement planting phase will be recorded in a bi-monthly woodland compensation monitoring reports prepared and submitted by the ET Leader within 10 working days from the end of each reporting month. The details to be included in the report will follow the Section 7.3 of the WCP.

Quarterly Woodland Compensation Monitoring Reports

2.4.2 Starting from the second year of the initial planting phase and the enhancement planting phase, the frequency of the monitoring is reduced to quarterly basis, the results and findings of the quarterly monitoring as well as the landscape inspection after the first year of the initial planting phase and the first year of the enhancement planting phase shall be recorded in the quarterly woodland compensation monitoring reports prepared and submitted by the ET Leader within 10 working days from the end of each reporting month. The details to be included in the report will follow the Section 7.3 of the WCP.

3. RESULTS

3.1 TRANSECT INSPECTION

3.1.1 The transect inspection was carried out on **22nd February 2021** with the ecological specialist of the IEC, an overview of the site condition is presented in **Appendix D**. According to the information provided by the Main Contractor, planting work within the WCA that covers the Stage 1 of the Phase 2 enhancement planting as well as the replacement planting of the initial planting work, was completed in the 2nd half of August 2019 (see **Appendix E** for the as-built record of the planting work), as such the transect inspection have covered all the species planted for the initial and enhancement planting phase and the following presents the observations made along the transect route:

- The transect inspection was undertaken on a sunny day. According to Hong Kong Observatory, mainly attributing to the exceptional warm and sunny weather in February 2021, the winter from December 2020 to February 2021 was warmer than usual in Hong Kong, and also much dryer than usual in Dec/2020 – Jan/2021 with only a limited rainfall (“traces” in Dec ’20 and ~6% of normal in Jan ’21)
- Signs of anthropogenic disturbance within the WCA were noted along the transect route on the hillslope and ridgeline of Cheung Shan, and snapped branches of woody plants, or damaged *Acacia mangium* trees, were frequently noted. On the other hand, vigorous growth of ground cover (especially the fern *Dicranopteris pedata*) has also noticed during the transect inspection, where planted woody seedlings would found shaded under the fond of the fern or leaves of other herbaceous plants.
- The overall health condition of those species planted for the initial planting phase was generally fair, and the native species *Schima superba*, *Melastoma sanguineum*, *Rhodomyrtus tomentosa* and *Gordonia axillaris*, as well as the exotic *Acacia mangium*, were found in good condition. Re-sprouting of the deciduous *Phyllanthus emblica* has also be noted.
- The tree species planted for the enhancement planting phase were only occasionally encountered* as single individual or in cluster along the transect on the hillslope, and found to be more abundant along the eastern ridgeline or near the bottom of the slope; and they are mostly appeared in fair condition with the tree *Schefflera heptaphylla*, *Reevesia thyrsoidea*, the shrubs *Melicope pteleifolia*, *Psychotria asiatica* and *Ilex asprella* appeared to be well established and generally in good condition.
- Nonetheless, besides the planted deciduous tree species *Celtis sinensis*, saplings of the planted tree *Alangium chinense* and *Bischofia javanica*, also have not been noted along the transect. (*note: whereabouts exactly the seedlings of each of the planted species were planted within the WCA was unknown to the Environmental Team, and their locations could beyond the coverage of the visual inspection along the transect).

3.1.2 The general health condition of the species planted in the initial planting phase, based on the observations made along the transect, is tabulated in the following table.

Table 2 Health condition of the established seedlings noted during the transect inspection

Species	Planting Phase (I – Initial/ E - Enhancement)	Health Condition#		
		Good	Fair	Poor
<i>Acacia confusa</i>	I		√	
<i>Acacia mangium</i>	I	√		
<i>Castanopsis fissa</i>	I		√	
<i>Litsea glutinosa</i>	I		√	

Species	Planting Phase (I – Initial/ E - Enhancement)	Health Condition#		
		Good	Fair	Poor
<i>Mallotus paniculatus</i>	I		√	
<i>Phyllanthus emblica</i> *	I		√	
<i>Sapium discolor</i> *	I		√^	
<i>Schima superba</i>	I ⁽⁵⁾ & E	√		
<i>Bridelia tomentosa</i>	E		√^	
<i>Alangium chinense</i>	E	n/a**		
<i>Cinnamomum camphora</i>	E		√^	
<i>Aquilaria sinensis</i>	E		√	
<i>Bischofia javanica</i>	E	n/a**		
<i>Celtis sinensis</i>	E	n/a**		
<i>Ficus hispida</i>	E		√^	
<i>Cinnamomum parthenoxylon</i>	E		√^	
<i>Garcinia oblongifolia</i>	E		√^	
<i>Reevesia thyrsoidea</i>	E	√		
<i>Schefflera heptaphylla</i>	E	√		
<i>Sterculia lanceolata</i>	E		√^	
<i>Liquidambar formosana</i> *	I ⁽¹⁾ & E		√	
<i>Gordonia axillaris</i>	I ⁽²⁾ & E	√		
<i>Melastoma candidum</i>	I		√	
<i>Melastoma sanguineum</i>	I	√		
<i>Rhaphiolepis indica</i>	I		√	
<i>Rhodomyrtus tomentosa</i>	I	√		
<i>Ficus hirta</i>	E		√^	
<i>Ilex asprella</i>	I ⁽³⁾ & E	√		
<i>Melicope pteleifolia</i>	E	√		
<i>Psychotria asiatica</i>	I ⁽⁴⁾ & E	√		

Note:

It is impracticable and sometimes unfeasible to differentiate self-seeded seedlings or wild population from those planted under the WCP, the health condition was evaluated as a whole for each of the species regardless their possible origin during the transect walk.

^ only occasionally encountered along transect route

* Deciduous species

**Not available - not observed along the transect

(1) Planted as substitution for *Litsea glutinosa* during replacement replanting in Aug 2019

(2) Include newly planted individuals as substitution for *Melastoma candidum* during replacement replanting in Aug 2019

(3) Planted as substitution for *Melastoma sanguineum* during replacement replanting in Aug 2019

(4) Planted as substitution for *Rhaphiolepis indica* during replacement replanting in Aug 2019

(5) Also planted as substitution for *Sapium discolor* in the Initial Planting Phase

3.2 QUADRAT SAMPLING

3.2.1 The nine 20m x 20m sampling quadrats have been placed within the planted area of the WCA, and at area where the majority of the seedlings were planted and considered suitable for long term monitoring; in which 2 of them were located on the ridgeline and the rest are located on the north-facing slope of Cheung Shan (see **Appendix C**). The quadrat monitoring was conducted on **22nd and 23rd February 2021**, and the weather was dry and sunny on both days. **Appendix D** illustrates the condition of the quadrats during the time of monitoring.

3.2.2 With respect to the latest status of the planting works undertaken and completed within

the monitoring quadrats, the baseline reference for evaluating survival rate has already been updated in previous report by making reference to the as-built record of planting works in Aug 2019, and shown in the Table 3 below for reference.

Table 3 Latest Baseline Quantity Referenced for Evaluating Survival Rate of the Species Planted for Initial and Enhancement Planting Phase

Species	Planting Phase (I – Initial/ E - Enhancement)	Baseline Reference (BR) ^	Qty. Presented in Jun '19 Report	Planted Qty. in Aug '19 (Replacement Planting/ Enhancement Planting)/	Updated Baseline Reference (BR)	Note

Notes: ^ General health condition of the species noted within the monitoring quadrats, and the rating may be different from those

determined under the transect inspection and presented in Table 2:

- Good - No. in normal font type (e.g., “99”)
- Fair - No. in Italic font (e.g., “*99*”)
- Poor - No. in italic & underlined (e.g., “*99*”)

* the quantity include all individuals of the planted species within the quadrat regardless whether their origin

it is assumed that thinning has been undertaken during the enhancement planting work

Table 5 Survival Rate of the Species Planted within the WCA

Species	Planting Phase (I – Initial/ E - Enhancement)	Reference Baseline ^	Total Qty.# Recorded in Quadrat Monitoring (Feb’21)	Survival Rate * (%)	Changed in Survival Rate (%) when compared with Previous Monitoring
<i>Tree</i>					
<i>Acacia confusa</i>	I	113	71	62.8	-11.5
<i>Acacia mangium</i>	I	193	115	59.6	-5.7
<i>Castanopsis fissa</i>	I	39	33	84.6	-2.6
<i>Litsea glutinosa</i>	I	40	34	85.0	-7.5
<i>Mallotus paniculatus</i>	I	80	186	100.0	0.0

^ see Table 3

refer to Table 4

* no. in bold denotes the survival rate of this species reach the trigger level, whereas no. in bold and italic denote the survival rate of this species reach the action level (see Table 1)

3.2.4 Based on the recorded data and observations made within the sampled quadrats and the data presented in **Tables 4** and **5**, the following provides a brief account of the findings from the quadrat monitoring:

- Health condition: Generally speaking, the health condition of the seedlings planted for the initial or enhancement phase within the quadrats was found either in fair or good condition.
- Survival Rate: According to the last 2 columns of the Table 5, among the 30 species planted, except the *Celtis sinensis* where it never recorded within the quadrat since planted, the survival rate of the planted species was ranged from 7.7% (*Sapium discolor*) to 100% (*Mallotus paniculatus* and *Schima superba*). Furthermore, except for the 4 species mentioned above, a decrease in survival rate was recorded for all of the other species (details refer to Table 5 above).
- As a whole, except 6 species recorded with > 80% survival rate (, i.e., *Castanopsis fissa*, *Litsea glutinosa*, *Mallotus paniculatus*, *Schima superba*, *Rhaphiolepis indica* and *Rhodomyrtus tomentosa*), as well as the *Melastoma sanguineum* recorded with a survival rate of 71.8%, the remaining 23 species all recorded with a survival rate below 70% during the monitoring period.
- The overall decrease in survival rate of the planted species during the monitoring period may due to the excessive desiccation stress resulted from the exceptional warm and sunnier weather in Hong Kong in Dec '20 to Feb '21, as well as the much drier and limited rainfall in Dec '20 and Jan '21. Nonetheless, it has already speculated that the poor survival rate of those species planted for enhancement planting may due to the poor vigor of the planted seedlings or poor recovery of the seedlings from the transplanting shock, especially under the unusual drier weather in Hong Kong since the seedlings was planted in Sep '19 as well as during the growing season in 2020.
- Regardless whether the poor survival rate of those species recorded with survival rate <70% is related to usual drier weather condition, or the seedlings were out-competed by other self-established or planted woody plants, the updated replanting arrangements as detailed in Table 6 and 7 below are recommended, in which *Schima superba* has been recommended to substitute *Sapium discolor*. The necessity for the replanting of the *Gordonia axillaris*, which is one of the species well-established under the planting program, will be further reviewed from future monitoring. On the other hand, action for both *Acacia sp.* would not be unnecessary as they were planned for thinning in the planting program.

- The Contractor would be responsible for implementing action of replanting and other remedial measures agreed by AFCD. All of the replanting works should make reference and conform to the Section 5 “Planting Management” of the approved Woodland Compensation Plan (WCP), in particular it should be undertaken within the planting season and in suitable planting area based on their habitat/micro-habitat requirements, and should not be shaded from adjacent plants to avoid competition for light and other resources.
- Any pre-planting site preparation work such as clearance of herbaceous plants (in particular the fern *Dicranopteris pedata*), if required to facilitate the replanting work, should be completed prior the delivery of seedlings on-site as such to expedite the planting work and facilitate their recovery from the planting shocks; and the site preparation work should be undertaken with care to avoid any damage caused to the existing woody plants.
- Finally, with respect to the timing of this reporting and the replanting program, it is recommended to carry out the replanting work at the onset of growing season, i.e., March 2021 as such to safeguard and increase the chance of recovery of the planted seedlings from the transplanting shock, and hence the survival rate of the planted seedlings.

Table 6 Recommended Replanting Quantity for Species Recorded with Survival Rate <70%

Species	Survival Rate % (Feb. 2021)	Reference Quantity ^	Qty. to be Replanted
<i>Phyllanthus emblica</i>	34.4	2350	1542
<i>Sapium discolor</i>	7.7	783	723 (to be substituted by <i>Schima superba</i>)
<i>Bridelia tomentosa</i>	10.0	163	147
<i>Alangium chinense</i>	10.0	327	294
<i>Cinnamomum camphora</i>	50.0	163	82
<i>Aquilaria sinensis</i>	54.3	327	149
<i>Bischofia javanica</i>	15.0	163	139
<i>Celtis sinensis</i>	0.0	163	163
<i>Ficus hispida</i>	15.0	163	139
<i>Cinnamomum parthenoxylon</i>	10.0	163	147
<i>Garcinia oblongifolia</i>	14.3	327	280
<i>Reevesia thyrsoidea</i>	11.4	327	290
<i>Schefflera heptaphylla</i>	17.8	327	269
<i>Sterculia lanceolata</i>	17.5	327	270
<i>Liquidambar formosana</i>	26.7	1323	970
<i>Melastoma candidum</i> [^]	60.3	5927	2353 (to be substitute with <i>Gordonia axillaris</i>)
<i>Ficus hirta</i>	32.0	2451	1667
<i>Ilex asprella</i>	35.2	7174	4649
<i>Melicope pteleifolia</i>	56.7	490	212
<i>Psychotria asiatica</i>	25.3	8088	6042

[^] Except *Sapium discolor* and *Melastoma candidum* where the reference qty. would be the qty. planted for the initial planting phase minus those that has been substituted during the replacement planting in 2019 (i.e., 2350-1567=783 for *Sapium discolor* and 15340-9413=5927), the reference quantity of the others refer to the qty. planted during the quantity original planted

Table 7 Recommended Replanting Quantity for Each of the Quadrat to Restore the Reference Baseline in the Monitoring Program

Species	Qty. to be Replanted#	Quantity *								
		R1	R2	S3	S4	S5	S6	S7	S8	S9
