Attention: Mr Eddie LUK

Dear Sir

Agreement No. CE 45/2008 (CE)
Liantang/Heung Yuen Wai Boundary Control Point and Associated Works
Independent Environmental Checker – Investigation
Quarterly Ecological Monitoring Report for Woodland Compensation Area
(Stage 2 Enhancement Planting) (No. 9) – March 2021 to May 2021

With reference to the Quarterly Ecological Monitoring Report for Woodland Compensation Area (Stage 2 Enhancement Planting) No. 9 for March 2021 to May 2021 (Version 2) certified by the ET Leader and received by IEC on 28 June 2021, please note that we have no adverse comments on the captioned submission. We herewith verify the captioned submission in accordance with Section 8.3.2.2 of the EM&A Manual.

Thank you for your attention and please do not hesitate to contact the undersigned on tel. 3995-8120 or by email to antony.wong@smec.com; or our Mr Arthur CHIU on tel. 3995-8144 or by email to arthur.chiu@smec.com.

Yours faithfully

Antony WONG

1. INTRODUCTION

1.1 GENERAL

- 1.1.1 The "Liantang/Heung Yuen Wai Boundary Control Point and Associated Works Project" (hereinafter referred to as "the Project") comprises a new Boundary Control Point (BCP) proposed at Liantang/Heung Yuen Wai (LT/HYW), its connecting road and other associated works; and the Environmental Impact Assessment (EIA) report (Register No.:AEIAR-161/2011) of the Project has identified that ~6.2ha of secondary woodlands will be directly lost due to the construction of the portals of tunnels and some sections of the connecting road. Subsequently, creation of a 18.6 ha compensatory woodland at Cheung Shan has been recommended in the EIA report to avoid residual ecological impacts from the Project.
- 1.1.2 Under the Environmental Permit (EP-404/2011/D), an updated Woodland Compensation Plan (WCP) detailed with the planting strategy and the subsequent maintenance and monitoring requirements of the compensatory woodland has been submitted and approved by the Authority in the 4th Quarter of 2015, and a revision of the updated WCP (i.e., WCP Revision 2) has been approved by EPD in 2017.
- 1.1.3 The woodland compensation include an initial planting phase and enhancement planting phase over a 6 years period on the grassland and shrubland at Cheung Shan, i.e., the "Woodland Compensatory Area" (WCA) as shown in the **Drawing No. 60212563/SK7037 of the WCP** and included here as *Appendix A*; and the planting works fall within the work scope of Contract No. CV/2013/08 Liantang/ Heung Yuen Wai Boundary Control Point Site Formation and Infrastructure Works Contract 6.
- 1.1.4 In accordance with the EM&A's requirements and the monitoring schedule stated in the approved WCP (ver. 2) of the Project, as well as the latest status of the planting work that have been undertaken with the WCA, the Stage 2 enhancement planting (Phase 1) work has already covered all the monitoring quadrats in August 2019, as such this submission presents the findings of the 9th vegetation monitoring of the enhancement planting phase and covers the Reporting Period from *March 2021 to May 2021*, so as to address the monitoring frequency specified in S.7.2 of the approved WCP, i.e., quarterly monitoring after the first year of enhancement planting work.
- 1.1.5 Furthermore, since the vegetation monitoring is continuous from those undertaken for the initial planting phase, as such the monitoring has also covered those species previously planted, and if necessary the evaluation of their survival rate will take into account the increased in density or coverage of woody plants and hence changes in micro-climate of the monitoring quadrats (such as the decreased light exposure from the canopy of young trees or other woody plant, or increased competition for light, space and nutrient from the increased density of woody vegetation).

2. MONITORING REQUIREMENTS

2.1 MONITORING PROGRAM OF THE INITIAL AND ENHANCEMENT PLANTING PHASES

- 2.1.1 According to the Section 6.5 of the WCP (ver. 2), the frequency of the monitoring is proposed to be bi-monthly during the first year of the initial planting and enhancement planting phase and should be reduced to quarterly from the second year.
- 2.1.2 Change of monitoring frequency if needed will be advised by the Project Ecologist of the ET and approved by Environmental Protection Department (EPD) and Agriculture, Fisheries and Conservation Department (AFCD) before implementation.

2.2 MONITORING METHODOLOGY

- 2.2.1 An inspection walk monitoring by means of "transect route" and "direct observation" has been undertaken within the WCP as such to provide an overview and observe the general condition of the WCA; After due considerations of the latest planting arrangement within the WCA, the potential trampling damage to the planted seedlings, as well as the limitations in visibility, site access and safety concern when undertaking the monitoring among the steep hillslope, the transect routes has been selected to cover all representative areas where planting has been undertaken within the WCA as far as practicable.
- 2.2.2 The transect routes are illustrated in **Appendix C**, and the following observations have been made during the inspection walk:
 - Weather condition during the time of monitoring
 - The general condition of the WCA, including any signs of anthropogenic or natural disturbance/events (such as landslide, lighting strikes, wildlife damage) that has affected the health condition of the planted seedlings, or regeneration or invasive of grassy or self-seeded weedy plants that would or have affected the establishment of the planted vegetation
 - The general health condition of each planted species graded in "Good", "Fair" or "Poor" with the following criteria:
 - i) Phenology signs of any abnormality in the phenology of the species (such as abnormal flowering/fruiting/ leaf shedding)
 - ii) Foliage colour, size and general appearance, signs and severity of insect and fungal infection
 - iii) Branches presence and extent of die-back, and signs and severity of insect and fungal infection
 - iv) Stem/Trunk signs and severity of cavities or internal/external decay; signs and severity of insect infection and mechanical damage
- 2.2.3 Since the monitoring approach adopted for the transect inspection, i.e., "direct observations", would not yield any quantitative information, the survival rate (%) of the planted seedling will be evaluated from the results collected from the quadrat sampling as detailed in next section.

2.3 **QUADRAT SAMPLING**

A sampling approach has been proposed in the WCP to monitor the survival rate of the planted seedlings by the use of nine 20mx20m quadrats which are to be evenly located within the planted area of the WCA. Based on the as-built planting plan provided by the contractor (see **Appendix B**), as well as the local topography of the planted area within the WCA, the practicality in accessing, placing and monitoring nine 20m x 20m fixed quadrats within the planted area of the WCA has been extensively reviewed, 2 of the monitoring quadrats are fixed on the ridgeline of Cheung Shan and 7 of them are located on the north-facing slope of the WCA (see **Appendix C**).

- 2.3.2 Information collected within each sampling unit include:
 - General condition of the sampling quadrat especially those factors that would or
 have found affected the survival rate of the planted vegetation, including biological
 or environmental factors (such as inter-specific competition as well as signs of
 stress from water, heat, or pest and disease, etc)
 - The total number of established seedlings for each planted tree and shrub species
 - Health condition of each planted species graded in "Good", "Fair" or "Poor" with the following criteria:
 - i) Phenology signs of any abnormality in the phenology of the species (such as abnormal flowering/fruiting/ leaf shedding)
 - ii) Foliage colour, size and general appearance, signs and severity of insect and fungal infection
 - iii) Branches presence and extent of die-back, and signs and severity of insect and fungal infection
 - iv) Stem/Trunk signs and severity of cavities or internal/external decay; signs and severity of insect infection and mechanical damage
- 2.3.3 The survival rate of the planted species during the initial planting phase and enhancement planting phase will be evaluated against the latest updated referenced baseline as shown in the **Table 3** below, if needed the implementation of the measures as detailed in the "Trigger and Action Levels" specified in the **Table 3** of the WCP would be recommended (included here as **Table 1** below).

Table 1 Trigger and Action Levels for Monitoring and Action Plan

Parameters	Trigger and Action Level	Action Plan
General Health Condition of planted species (i.e. good/fair/poor; based on parameters e.g. wilting, insect attack, disease, fungal infection, browsing damage)	Trigger Level: % of individual plant species in poor health condition >20%	 the ET should inform Contractor and IEC immediately; identify the causes(s) of the exceedance; advise Contractor the necessity of replanting
	Action Level: % of individual plant species in poor health condition >30%	 the ET should inform Contractor and IEC immediately; identify the cause(s) of the exceedance; advise remedial action and work out solution including change of species in re-planting, re-soiling of the target areas; and seek acceptance from AFCD; once the remedial action has been accepted by AFCD, the Contractor should implement the remedial action.
Survival of Planted Species (i.e. dead)	Trigger Level: Survival rate of individual plant species <80%	 the ET should inform Contractor and IEC immediately; identify the causes(s) of the exceedance; advise Contractor the necessity of replanting.

Action Level:	- the ET should inform Contractor
Survival rate of	and IEC immediately;
individual plant	- identify the cause(s) of the
species	exceedance;
< 70%	- advise remedial action and work
	out solution including change of
	species in re-planting, re-soiling
	of the target areas; and seek
	acceptance from AFCD;
	- once the remedial action has
	been accepted by AFCD, the
	Contractor should implement the
	remedial action.

- 2.3.4 Since most of the planted native species are also naturally grown within the WCA and it would be infeasible and impracticable to differentiate whether the individual plant encountered along the transect or within the quadrat is planted, natural recruited, or regenerated after the pre-planting clearance of the site; and hence all established individuals of the planted species found within the sampling unit has been counted during the monitoring.
- 2.3.5 The WCA monitoring was undertaken by the Environmental Team (ET) and under the supervision of the Qualified Ecologist of the ET, and the Qualified Ecologist has also undertaken a joint transect inspection with representative of the IEC in the reporting.

2.4 REPORTING

Bi-monthly Woodland Compensation Monitoring Reports

2.4.1 The results and findings of the bi-monthly (i.e., once every two months) monitoring including the landscape inspection during the first year of the initial planting phase and the first year of the enhancement planting phase will be recorded in a bi-monthly woodland compensation monitoring reports prepared and submitted by the ET Leader within 10 working days from the end of each reporting month. The details to be included in the report will follow the Section 7.3 of the WCP.

Ouarterly Woodland Compensation Monitoring Reports

2.4.2 Starting from the second year of the initial planting phase and the enhancement planting phase, the frequency of the monitoring is reduced to quarterly basis, the results and findings of the quarterly monitoring as well as the landscape inspection after the first year of the initial planting phase and the first year of the enhancement planting phase shall be recorded in the quarterly woodland compensation monitoring reports prepared and submitted by the ET Leader within 10 working days from the end of each reporting month. The details to be included in the report will follow the Section 7.3 of the WCP.

3. RESULTS

3.1 TRANSECT INSPECTION

- 3.1.1 The transect inspection was carried out in a sunny day on 27th May 2021 with the ecological specialist of the IEC, an overview of the site condition is presented in *Appendix D*. According to the information provided by the Main Contractor, planting work within the WCA that covers the Stage 2 of the Phase 2 enhancement planting as well as the replacement planting recommended in previous monitoring report, was completed in late April/early May 2021 (see *Appendix E* for the as-built record for the planting work), as such the transect inspection have covered all the species planted for the initial and enhancement planting phase and the following presents the observations made along the transect route:
 - According to Hong Kong Observatory, the monitoring period was much warmer and drier than usual in Hong Kong, in which March and May was the hottest corresponding months in record, and the total rainfall during the period was only ~19.5% of the normal figure.
 - Removal of the two exotic tree species planted during the initial planting phase, i.e., the *Acacia confusa* and *Acacia mangium*, was noted throughout within the WCA, and clusters of the removed tree logs were occasionally spotted on the hillslope. Nonetheless, re-sprouting has been observed on some of the remained tree stumps.
 - Signs of anthropogenic disturbance from planting/tree felling works, as well as clearance of ground cover (especially the fern *Dicranopteris pedata*) in the planting area, were also noted along the transect route.
 - The overall health condition of those species planted for the initial planting phase was generally fair, and the native species *Schima superba*, *Mallotus paniculatus*, *Rhodomytrus tomentosa* and *Polyspora axillaris* were found in good condition. Vigorous re-sprouting of the deciduous tree *Phyllanthus emblica* has also been noted.
 - The tree species planted for the enhancement planting phase were mostly only occasionally encountered along the transect on the hillslope but more commonly found on the eastern ridgeline or near the bottom of the slope; and those established are mostly appeared in fair or good condition, such as the tree *Reevesia thyrsdidea*, the shrubs *Melicope pteleifolia*, *Psychotria asiatica* and *Ilex asprella*.
 - Most of the seedlings being replanted within the WCA recently were found wilted
 or totally defoliated, except for *Bridelia tomentosa*, *Cinnamomum camphora*, *Cinnamomum parthenoxylon*, *Aquilaria sinensis* where they were largely
 appeared healthy, and re-sprouting was noted for the deciduous tree *Celtis sinensis* and *Liquidambar formosana*.
- 3.1.2 The general health condition of the species planted in the initial planting phase, based on the observations made along the transect, is tabulated in the following table.

Table 2 Health condition of the established seedlings noted during the transect inspection

Note:

\$ included for information only - exotic trees to be removed before end of the establishment period # It is impracticable and sometimes unfeasible to differentiate self-seeded seedlings or wild population from those planted under the WCP, the health condition was evaluated as a whole for each of the species regardless their possible origin during the transect walk.

- (1) Planted as substitution for Litsea glutinosa during replacement replanting in Aug 2019
- (2) Include newly planted individuals as substitution for Melastoma candidum during replacement replanting in Aug 2019 and April/May 2021
- (3) Planted as substitution for Melastoma sanguineum during replacement replanting in Aug 2019
- (4) Planted as substitution for Rhaphiolepis indica during replacement replanting in Aug 2019
- (5) Also planted as substitution for Sapium discolor in the Initial Planting Phase in April/May 2021

3.2 **QUADRAT SAMPLING**

- 3.2.1 The nine 20m x 20m sampling quadrats have been placed within the planted area of the WCA, and at area where the majority of the seedlings were planted and considered suitable for long term monitoring; in which 2 of them were located on the ridgeline and the rest are located on the north-facing slope of Cheung Shan (see Appendix C). quadrat monitoring was conducted on 25th and 27th May 2021, and the weather was rainy and sunny respectively on day of monitoring. Illustration of the quadrats condition during time of monitoring is shown in *Appendix D*.
- 3.2.2 With respect to the latest status of the planting/replanting works undertaken and completed within the monitoring quadrats, the baseline reference for evaluating survival

[^] only occasionally encountered along transect route

^{*} Deciduous species

^{**}Not available - not observed along the transect

rate has been updated by making reference to the revised baseline established in September 2019, the findings of previous monitoring report, as well as the as-built record of the replanting works undertaken in April/May 2021 (see Table 3 below for details).

^{\$} provided for information only - exotic species to be eradicated from the WCA

- 3.2.4 Based on the recorded data and observations made within the sampled quadrats and the data presented in *Tables 4* and 5, the following provides a brief account of the findings from the quadrat monitoring:
 - Health condition: Generally speaking, the health condition of the seedlings
 planted for the initial or enhancement phase within the quadrats was found either
 in fair or good condition, except those recently planted where wilting was
 observed in some of the planted seedlings.
 - Survival Rate: Survival rate of the two exotic tree species *Acacia confusa* and *Acacia mangium*, as well as the *Sapium discolor*, will be excluded from the evaluation as the former two species to be eradicated from the WCA and the baseline reference of the latter (1 no.) is too small for any meaningful evaluation.
 - The survival rate of the other 27 species is ranged from "0%" (*Ficus hispida*) to 100% (*Mallotus paniculatus*); and an increase in survival rate was recorded for 10 of the species (see Table 5 above).
 - As a whole, except the *Mallotus paniculatus* and *Schima superba* where both of their recorded survival rate were >80%, 22 of the remaining 25 species were recorded with a survival rate below 70%, and the other 3 were in between 70% and 80%.
 - The poor survival rate of the planted species during the monitoring period may due to the excessive desiccation stress from the exceptional warm and limited rainfall over the monitoring period (see 1st bullet of S.3.1.1), especially for those species where replanting was recently completed as the seedlings may yet acclimatize to the planting site and recovered from the transplanting shock. Nonetheless, re-sprouting of *Celtis sinensis* and *Liquidamber formosana* was frequently observed on the newly planted seedlings.
 - Regardless whether the poor survival rate recorded is related to the exceptional
 water stress, poor vigor of the seedlings, or out-competed by other self-established
 or planted woody plants, it is recommended to review and confirm the necessity
 of any replanting work from the data to be collected from next monitoring.

[&]amp; provided for information only – see Table 3

[^] see Table 3

[#] refer to Table 4

^{*} no. in bold denotes the survival rate of this species reach the trigger level, whereas no. in bold and italic denote the survival rate of this species reach the action level (see Table 1)

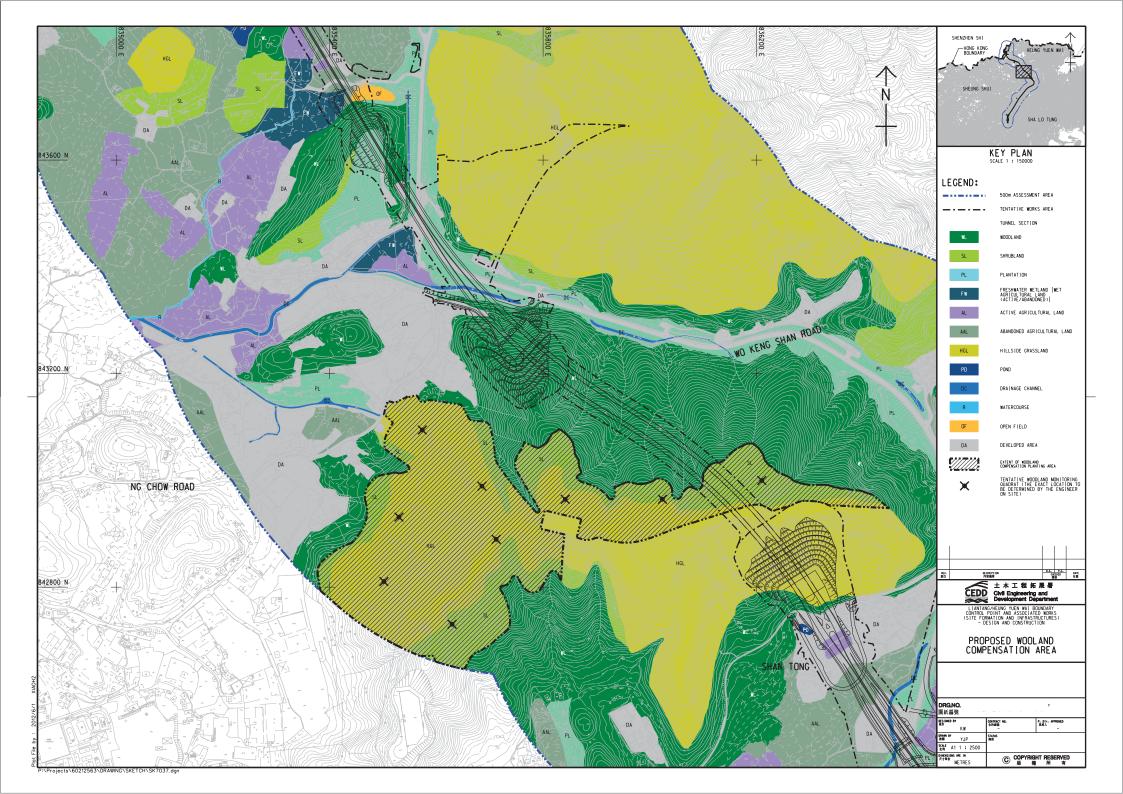

- The Contractor would be responsible for implementing action of replanting and other remedial measures agreed by AFCD. All of the replanting works should make reference and conform to the Section 5 "Planting Management" of the approved Woodland Compensation Plan (WCP), in particularly it should be undertaken within the planting season and in suitable planting area based on their habitat/micro-habitat requirements, and should not be shaded from adjacent plants to avoid competition for light and other resources.
- Any pre-planting site preparation work such as clearance of herbaceous plants (in particularly the fern *Dicranopteris pedata*), if required to facilitate the replanting work, should be completed prior the delivery of seedlings on-site as such to expedite the planting work and facilitate their recovery from the planting shocks; and the site preparation work should be undertaken with care to avoid any damage caused to the exiting woody plants.
- Finally, the Project Team is also recommended to review the measures and planting program to minimize the potential desiccation stress of the seedlings during the transit, storage, as well as before and after replanting work on-site
