1 INTRODUCTION

1.1 BACKGROUND

At present, traffic queues are already observed on the northern approach of the Pok Oi Roundabout (POR) during the evening peak period and on the southern approach at both morning and evening peaks. The situation will likely deteriorate further when the nearby developments are completed. The tailback of traffic onto the southbound carriageway on the northern approach to POR may block the through traffic from Tai Lam Tunnel / New Territories (NT) North to Tuen Mun / Tin Shui Wai / Hong Kong – Shenzhen Western Corridor.

The *Technical Feasibility Statement* (TFS) for the Improvement to Pok Oi Interchange was completed in November 2005. In September 2006, Highways Department (HyD) commissioned Mott Connell Ltd (MCL) to undertake the *Traffic Impact Assessment* and *Alignment Design Study (Agreement No. WD 3/2006)*. The Study reviewed the preliminary improvement layouts proposed in the TFS, presented recommendations on the preferred alignment, configuration and layout, and investigated the traffic carrying capacities of the improvement scheme.

An application under the *Environmental Impact Assessment Ordinance (EIAO)* for an *Environmental Impact Assessment (EIA) Study Brief* was submitted by HyD in May 2007 with the *EIA Study Brief* (No. ESB-166/2007) issued in July 2007.

ERM-Hong Kong, Ltd (ERM), supported by Halcrow China Ltd (Halcrow), has been commissioned by HyD to undertake the *Improvement to Pok Oi Interchange – Environmental Impact Assessment Study* (hereafter referred to as "the Assignment") under *Agreement No. WD 6/2007*. As part of the Assignment, an EIA Study has been undertaken in accordance with the *EIA Study Brief* (No. ESB-166/2007).

This *EIA Report* addresses the nature and extent of the potential environmental impacts associated with the construction and operation of the Improvement to the Pok Oi Interchange (hereafter referred to as "the Project").

1.2 OBJECTIVES OF THE EIA STUDY

The overall objectives of the EIA Study are to provide information on the nature and extent of environmental impacts arising from the Project and related activities that take place concurrently; to recommend appropriate mitigation measures to control the potential environmental impact so that it complies with the requirements of the *Technical Memorandum on Environmental Impact Assessment Process of Environmental Impact Assessment Ordinance* (*EIAO-TM*), and to confirm the environmental acceptability of the Project. An

analysis to identify elements of the Project that qualify as Designated Projects (DPs) is presented in *Section 2.2*.

The specific objectives of the EIA Study described in the *EIA Study Brief* are as follows:

(i) to describe the Project and associated works together with the requirements for carrying out the Project;

(ii) to identify and describe elements of community and environment likely to be affected by the Project and/or likely to cause adverse impacts to the Project, including natural and man-made environment and the associated environmental constraints;

(iii) to provide information on the consideration of alternatives to avoid and minimise the potential environmental impacts to environmentally sensitive areas and other sensitive uses; to compare the environmental benefits and dis-benefits of each of the different options; to provide reasons for selecting the preferred option(s) and to describe the part of environmental factors played in the selection of preferred option(s);

(iv) to identify and quantify all environmental sensitive receivers, emission sources and determine the significance of impacts on sensitive receivers and potential affected uses;

(v) to identify and quantify any potential landscape and visual impacts and to propose measures to mitigate these impacts;

(vi) to propose the provision of mitigation measures so as to minimize pollution, environmental disturbance and nuisance during construction and operation of the Project;

(vii) to investigate the feasibility, practicability, effectiveness and implications of the proposed mitigation measures;

(viii) to identify, within the Study Area, any individual project(s) that fall under Schedule 2 and/or Schedule 3 of the *EIAO*; to ascertain whether the findings of this EIA Study have adequately addressed the environmental impacts of those projects; and where necessary, to identify the outstanding issues that need to be addressed in any further detailed EIA study;

(ix) to identify, predict and evaluate the residual environmental impacts (i.e. after practicable mitigation) and the cumulative effects expected to arise during the construction and operation phases of the Project in relation to the sensitive receivers and potential affected uses;

(x) to identify, assess and specify methods, measures and standards, to be included in the detailed design, construction and operation of the Project which are necessary to mitigate these environmental impacts and cumulative effects and reduce them to acceptable levels;

(xi) to investigate the extent of the secondary environmental impacts that may arise from the proposed mitigation measures and to identify constraints associated with the mitigation measures recommended in the EIA Study, as well as the provision of any necessary modification; and

(xii) to design and specify environmental monitoring and audit requirements to ensure the effective implementation of the recommended environmental protection and pollution control measures.

As specified in the *EIA Study Brief*, the EIA Study will address the following key environmental issues due to the construction and operation of the Project:

- potential noise and air quality impacts from the construction and operation of the Project to sensitive receivers along or near the Project, taking into account the cumulative impact from the operation of existing and planned roads and developments in the assessment area of the Project;
- potential water quality impact on the relevant water system(s) from the construction and operation activities of the Project;
- waste arising as a result of the construction activities of the Project and potential land contamination from land to be resumed for the Project; and
- potential landscape and visual impacts from the construction and operation of the Project especially impact caused by the above ground structures including noise mitigation measures.

1.3 ORGANISATION OF THE REPORT

The remainder of this report is organised as follows:

- *Section 2* describes the scope and the outline implementation programme of the Project and identifies the DP elements;
- *Section 3* presents the need for the Project and considerations given to alternative construction methods and works sequences;
- *Section 4* presents the noise assessment;
- *Section 5* presents the air quality assessment;
- *Section 6* presents the water quality assessment;
- *Section 7* assesses the waste management implications;
- *Section 8* presents the landscape and visual assessment;
- *Section 9* summarises the environmental outcomes associated with the Project; and

- *Section 10* describes the requirements for environmental monitoring and audit.

2 DESCRIPTION OF THE PROJECT

2.1 SCOPE OF THE PROJECT

The Project is located at the Pok Oi Interchange (POI) in the Yuen Long region of the North-West New Territories. The Study Area is generally rural in nature, with village houses at Wong Uk Tsuen and Small Traders New Village in the surrounding area and along the Yuen Long Highway, high-rise residential development at YOHO Town, educational institution at Kwong Ming Ying Loi School, Pok Oi Hospital and Jockey Club Care and Attention Home.

The proposed scope and alignment of the Project are shown in *Figure 2.1a* and described as follows:

- provision of a single lane flyover (approximately 140m in length) adjacent to the northbound carriageway of Pok Oi Flyover (POF) (denoted as Flyover A in *Figure 2.1a* and subsequent sections of this report);
- construction of a slip road (approximately 410m in length) connecting the northbound carriageway of the ground level road of Yuen Long Highway (YLH) on the southern arm of POR to the proposed flyover (denoted as Slip Road A in *Figure 2.1a* and subsequent sections of this report);
- construction of a slip road (approximately 100m in length) connecting the proposed flyover to the northbound carriageway of the ground level section of YLH on the northern arm of POR (denoted as Slip Road B in *Figure 2.1a* and subsequent sections of this report);
- construction of a slip road (approximately 280m in length) connecting the southbound carriageway of POF to the southbound carriageway of the ground level section of YLH on the southern arm of POR (denoted as Slip Road C in *Figure 2.1a* and subsequent sections of this report);
- resurfacing and re-marking of a stretch of the southbound carriageway (approximately 280m in length) of the ground level section of YLH on the northern arm of POR to increase the number of traffic lanes on the carriageway from three to four (denoted as Road Resurfacing and Remarking A in *Figure 2.1a* and subsequent sections of this report);
- resurfacing and re-marking of a stretch of the northbound carriageway (approximately 470m in length) of the ground level section of YLH on the northern arm of POR (denoted as Road Resurfacing and Remarking B in *Figure 2.1a* and subsequent sections of this report);
- construction of a segregated left-turn lane (approximately 110m in length) at the northern arm of POR (denoted as Left-turn Lane A in *Figure 2.1a* and subsequent sections of this report); and

- associated ancillary works.

An outline implementation programme of the Project is provided in *Annex A*.

2.2 *DESIGNATED PROJECT ELEMENTS*

An analysis has been conducted to identify elements of the Project that qualify as Designated Projects (DPs) under the provisions of the *EIAO*. The key focus is to analyse the Project with reference to Item A.1, Schedule 2 of the *EIAO* that defines 'a road which is an expressway, trunk road, primary distributor road or district distributor road including new roads, and major extensions or improvements to existing roads' as a DP.

The first step of the analysis considers whether any element of the Project qualifies as a DP by virtue of being a major extension or improvement to existing roads under the definition of Item A.1, Schedule 2 of the *EIAO*. For this part of the analysis, it is necessary to establish whether the road traffic noise impact due to any part of the proposed roadworks will result in significant traffic noise impact. The traffic noise impact is considered significant if the traffic noise level with the roadworks is greater than that without the roadworks at the design year by 1.0 dB(A) or more. If any part of the project causes significant increase in traffic noise, the whole project will become a DP. The detailed road traffic noise predictions are presented in *Section 4* and the assessment has confirmed that the traffic noise levels with any part of the proposed works of the Project will not be greater than that without the works at the design year by 1.0 dB(A) or more. As a result, the whole project is not a DP by virtue of Item A.1, Schedule 2 of the *EIAO*.

The roadworks of the Project will involve the construction of a number of discrete new road sections, including Flyover A, Slip Roads A, B and C and the segregated Left-turn Lane A. These proposed new road sections are classified according to the Road Classification System adopted by Transport Department (TD). The classification of the proposed new road sections, which was agreed with TD, is presented in *Table 2.2a*.

Table 2.2a Road Classication for Proposed New Road Sections of the Project

Proposed New Road Section	Classification
Flyover A	Rural Trunk Road
Slip Road A	Rural Trunk Road
Slip Road B	Expressway
Slip Road C	Rural Trunk Road
Segregated Left-turn Lane A	Rural Trunk Road

Table 2.2a indicates that each of the five new proposed new road sections of the Project qualify as DP by virtue of Item A.1, Schedule 2 or the *EIAO* for being new roads which are either an expressway or a trunk road. The extent of road sections qualified as a DP are presented in *Figure 2.2a*.

Road Resurfacing and Remarking A and B along stretches of the northbound and southbound carriageways of Yuen Long Highway on the northern arm of

POI will not involve any change in the road nature, alignment, and traffic capacity between the scenarios with and without the Project. In addition, no substantial construction works will be required. These elements of the Project do not qualify as DPs.

The Project will be physically connected with the existing roads and considerations have been given to check whether the proposed works would cause any material change in terms of other environment aspects, such as landscape and visual implications and ecological impact, to the existing roads that are exempted projects under the *EIAO*. No material change to exempted projects has been identified.

Based on the above analysis, it is concluded that the DP elements of the Project are those indicated in *Table 2.2a*.

2.3 TRAFFIC FORECAST

Traffic forecasts were provided by HyD. For the purpose of this EIA Study, peak hour traffic flows for years 2011, 2016, 2021 and 2026 have been forecasted for all major roads within 500m of the Project boundary. The traffic forecast employed for this assessment was endorsed by the Transport Department (TD) (*Annex B*).

2.4 CONSTRUCTION PROGRAMME

The construction of the Project is scheduled to commence in December 2009 and to be completed in December 2011.

2.5 CONCURRENT PROJECTS

The Project may have interactions with the following projects, which are currently envisaged to be constructed at the same time:

- Kau Hui Development - Engineering Works in Area 16, Yuen Long Phase 2 - Extension of Road L3 (Project No. 7721CL/A): The proposed project is for the extension of Road L3 in Yuen Long Area 16 located next to the MTR West Rail Yuen Long Station. The scope of the project mainly comprises the extension of an exiting carriageway by about 220m and its associated drainage and landscape works. The construction works are expected to commence in 2008 for completion in 2011.

- Proposed Left-Turn Lane at Pok Oi Interchange for the Development at YOHO Town Phase II: An exclusive left-turn lane for access to the planned private development of YOHO Town Phase II from Castle Peak Road – Yuen Long Section immediately west of POR will be constructed by Sun Hung Kai Properties Ltd together with the said development. The construction period is envisaged to be about one year. The works will be completed in or before 2010.

The locations of concurrent projects within 500m of the Study Area are indicated in *Figure 2.5a*.

3 CONSIDERATION OF ALTERNATIVES

3.1 INTRODUCTION

In accordance with the requirements of *Section 3.3* of the *EIA Study Brief*, this Section describes the need for the Project and the consideration of alternative construction methods and work sequence.

3.2 THE NEED FOR THE PROJECT

As highlighted in *Section 1*, traffic queues are already observed on the northern and southern approaches of POR during the evening peak period. The situation will likely deteriorate further when the nearby development is in place. The tailback of traffic on the southbound carriageway of the northern approach may block the through traffic from Tai Lam Tunnel / NT North to Tuen Mun / Tin Shui Wai / the Hong Kong – Shenzhen Western Corridor. It is envisaged that POR will become saturated progressively with the increasing population intake in the nearby area.

The objective of the Project is to relieve the traffic pressure and traffic queues of the existing POR so that its design flow / capacity ratio can be maintained at a reasonable value acceptable to the Transport Department (TD).

In accordance with the *Traffic Impact Assessment Report*[1], the Ratios of Flow to Capacity (RFC) of POR are 0.84 and 0.99 during AM and PM Peaks for the Year 2006, respectively. As demonstrated by the RFC, POR has almost reached its capacity in Year 2006. With the proposed improvement works, the RFC could be reduced from 1.05 to 0.57 and 1.22 to 0.78 in Year 2011 for the AM and PM Peaks, respectively. The proposed improvement works were shown to be capable of relieving the queuing problem at POR.

3.3 CONSIDERATIONS OF ALTERNATIVE CONSTRUCTION METHODS AND WORK SEQUENCE

Different construction methods for the foundation works, erection of the new flyover deck and retaining structures are examined based on the following criteria:

- Severity and duration of the construction impacts on the nearby environmental sensitive receivers;
- Traffic impacts on the existing carriageways;

[1] Traffic Impact Assessment Report prepared under the Agreement No. WD 3/2006 for Improvement to Pok Oi Interchange - Traffic Impact Assessment and Alignment Design Study dated July 2007.

- Site constraints, such as limited working spaces, unforeseen ground conditions and potential impacts on the existing structures;
- Satisfaction to the design requirements, such as loading requirements and retained heights; and
- Tight construction programme.

3.3.1 Options for Piling

Four piling options have been assessed during preliminary design, namely,

- ***Option A:*** Continuous Flight Auger Piles;
- ***Option B:*** Large Diameter Bored Piles***;***
- ***Option C:*** Pre-bored Concrete Piles; and
- ***Option D:*** Driven Steel H-piles.

The above options are considered common piling methods in Hong Kong and therefore the required machinery should be available in the Hong Kong market for foundation construction. Benefits and drawbacks of each option are discussed below and summarised in *Table 3.3a*:

Option A: Continuous Flight Auger (CFA) Piles

In this construction method, continuous flight auger is used to form the pile holes, which will be infilled with concrete or grout after the placing of steel reinforcement which would either be steel H-piles or rebar cages. The sizes of CFA piles range from 300mm to 700mm in diameter and the most common pile size is 610mm in diameter.

Benefits

- Piles can be installed without appreciable noise and vibration;
- Generally ground loss/disturbance is minimal during pile hole excavation and therefore less disturbance on the adjacent structures and piles;
- Compared with Options B and C, it is a more economic pile construction method under suitable ground condition (i.e. for cohesive soils) and satisfying load requirements;
- Less working spaces are required compared with Option B;
- Construction time is relatively fast; and
- There is no restriction on the normal working hours.

Drawbacks

- Pre-excavation or pre-boring may be required to cope with any underground obstruction such as boulders within the soil matrix;
- Compared with Option B, this pile type has less structural capacities to resist lateral and vertical loads;
- Specialist contractor may be required to ensure workmanship; and

- Designed pile length is limited by the construction plants and it is generally less than 40m.

Option B: Large Diameter Bored Piles

Shafts of the large diameter bored piles are constructed by traditional boring machines with temporary steel casings or drilling fluid as a supporting system. Chisel and grab system with casings, and Reverse Circulation Drilling (RCD) are the common large bored pile construction plants. Typical sizes of large diameter bored piles range from 1m to 3m in diameter. In Hong Kong, large diameter bored piles are usually designed as end-bearing piles founding in bedrock. For friction pile design, shaft-grouting may be provided to enhance the shaft frictional resistance.

Benefits

- Extensive experience of using this type of construction method has been developed in Hong Kong;
- Compared with Options C and D, less noise and vibration will be generated during pile installation;
- It is relatively easy to overcome underground obstructions;
- Compared with Option A, this construction method has higher flexibility in designing longer piles to suit design requirements;
- This pile type has larger structural capacities to cater for lateral and vertical loads; and
- With provision of temporary casings during pile excavation, shaft collapse and over-excavation can be minimized.

Drawbacks

- Comparatively larger working spaces are required due to larger piling plants required;
- It may be susceptible to bulging or necking during pile concreting in unstable ground due to the larger pile size;
- Compared with Options A and C, risk of loosening of surrounding soil is higher, causing ground movement and structural impacts on the adjacent structures; and
- Extension of working hours to the restricted hours may be required for concreting of very long piles.

Option C: Pre-bored Concrete Pile

Pile shafts are formed by drilling rigs with the use of down-the-hole hammers. Pre-bored concrete piles are considered as small diameter bored piles. Therefore, similar to the large diameter bored pile construction, the pre-bored holes will be inserted with rebar cages and in-filled with concrete. Shaft-grouting can also be provided for enhancing shaft resistance for friction piles.

Benefits

- It is relatively easy to overcome underground obstructions by down-the-hole hammers;
- Compared with Option A, this construction method has higher flexibility in designing longer piles to suit design requirements;
- Compared with Option D, less ground borne vibration will be induced;
- With provision of temporary casings during pile excavation, shaft collapse and over-excavation can be minimized.

Drawbacks

- Pile excavation by down-the-hole (DTH) hammer will cause disturbance affecting the adjacent structures and foundations;
- Construction Noise Permit (CNP) under the Noise Control Ordinance (NCO) will be required for the use of DTN hammer. Longer construction period may be required due to the restricted working hours imposed by the Authority;
- It may be susceptible to bulging or necking during pile concreting in unstable ground; and
- Possible collapse of the annulus space (over-cut) between the side wall and temporary casing before pile concreting would reduce the skin friction.

Option D: Driven Steel H-Pile

This construction method is to pitch H-piles using percussion method until final sets are achieved. A hydraulic hammer is commonly used for pile driving in Hong Kong. In bouldery grounds, pre-boring can be carried out before the insertion of the pile. The bored holes will be subsequently infilled with sand and the H-piles driven to design founding levels.

Benefits

- Pile installation method is relatively simple and degree of redundancy can be easily incorporated to provide flexibility to deal with any unexpected ground condition;
- Extensive experiences of driving H-piles within marble areas in Hong Kong;
- Installation is generally unaffected by groundwater conditions;
- Compared with Options A and C, this pile type can be designed to withstand high bending and tensile stresses; and
- Compared with Option A, this construction method has higher flexibility to design longer piles to suit design requirement.

Drawbacks

- The driving operation will generate relatively high noise and vibration levels, affecting the nearby environmental sensitive receivers;
- Construction Noise Permit (CNP) under the Noise Control Ordinance (NCO) will be required for percussion pile installation. Longer construction

period may be required due to the restricted working hours imposed by the Authority;

- Higher ground borne vibration and movement induced from the driving operation may cause damage to the adjacent piles, structures and utilities installations;
- Pre-boring may be required to overcome underground obstructions and require longer construction period.

3.3.2 Selection of Pile Construction Method

By comparing the above four options, Option A - Continuous Flight Auger (CFA) Pile is preferable in view of the following:

- Relatively less noise and vibration impacts;
- No restriction on normal working hours;
- Relatively fast construction rate;
- Less impacts to existing structures; and
- Satisfying the loading and ground condition requirements.

Table 3.3a Comparison of Alternative Pile Construction Methods

Options	Alternative Construction Methods	Benefits	Drawbacks
A	Continuous Flight Auger Pile	• Piles can be installed without appreciable noise and vibration; • Generally ground loss/disturbance is minimal during pile hole excavation and therefore less disturbance on the adjacent structures and piles; • Compared with Options B and C, it is a more economic pile construction method under suitable ground condition (i.e. for cohesive soils) and satisfying load requirements; • Less working spaces are required compared with Option B; • Construction time is relatively fast; and • There is no restriction on the normal working hours.	• Pre-excavation or pre-boring may be required to cope with any underground obstruction such as boulders within the soil matrix; • Compared with Option B, this pile type has less structural capacities to resist lateral and vertical loads; • Specialist contractor may be required to ensure the pile construction workmanship; and • Designed pile length is limited by the construction plants and it is generally less than 40m.
B	Large Diameter Bored Pile	• Extensive experience of using this type of construction method has been developed in Hong Kong; • Compared with Options C and D, less noise and vibration will be generated during pile installation; • It is relatively easy to overcome underground obstructions; • Compared with Option A, this construction method has higher flexibility in designing longer piles to suit design requirement; • This pile type has larger structural capacities to cater for lateral and vertical loads; and • With provision of temporary casings during pile excavation, shaft collapse and over-excavation can be minimized.	• Comparatively larger working spaces are required due to larger piling plants required; • It may be susceptible to bulging or necking during pile concreting in unstable ground due to the larger pile size; Compared with Options A and C, risk of loosening of surrounding soil is higher, causing ground movement and structural impacts on the adjacent structures; and • Extension of working hours to the restricted hours may be required for concreting of very long piles.
C	Pre-bored Concrete Pile	• It is relatively easy to overcome underground obstructions by down-the-hole hammers; • Compared with Option A, this construction method has higher flexibility in designing longer piles to suit design requirements; • Compared with Option D, less ground borne vibration will be induced; • With provision of temporary casings during pile excavation, shaft collapse and over-excavation can be minimized.	• Pile excavation by down-the-hole (DTH) hammer will cause disturbance affecting the adjacent structures and foundations; • Construction Noise Permit (CNP) under the Noise Control Ordinance (NCO) will be required for the use of DTN hammer. Longer construction period may be required due to the restricted working hours imposed by the Authority; • It may be susceptible to bulging or necking during pile concreting in unstable ground; and • Possible collapse of the annulus space (over-cut) between the side wall and temporary casing before pile concreting would reduce the skin friction.

Options	Alternative Construction Methods	Benefits	Drawbacks
D	Driven Steel H-Pile	• Pile installation method is relatively simple and degree of redundancy can be easily incorporated to provide flexibility to deal with any unexpected ground condition; • Extensive experiences of driving H-piles within marble areas in Hong Kong; • Installation is generally unaffected by groundwater conditions; • Compared with Options A and C, this pile type can be designed to withstand high bending and tensile stresses; and • The pile installation method has less settlement concern, which is essential for bridge structures.	• The driving operation will generate relatively high noise and vibration levels, affecting the nearby environmental sensitive receivers; • Construction Noise Permit (CNP) under the Noise Control Ordinance (NCO) will be required for percussion pile installation. Longer construction period may be required due to the restricted working hours imposed by the Authority; • Higher ground borne vibration and movement induced from the driving operation may cause damage to the adjacent piles, structures and utilities installations; • Pre-boring may be required to overcome underground obstructions and require longer construction period.

3.3.3 Options for Construction of New Flyover Deck

Three methods for construction of the new flyover deck have been examined. The benefits and drawbacks of each method are discussed below and summarised in *Table 3.3b*:

Option 1: Precast Segmental Balanced Cantilever Box Girder

Due to limited working areas on site and heavy traffic flows at the existing interchange, concrete box girder segments is likely to be used for construction of the flyover. They are usually cast in casting yards in Mainland China, and shipped to Hong Kong to the contractor's work area. The segments will be placed in a symmetrical manner about the pier head so as to create a balanced cantilever. The segments will be then fixed by post-tensioning. The same operation will continue until the box girder reaches the abutment or the adjacent completed balanced cantilever. In-situ stitch joint will be formed between the cantilevers to provide continuity of the bridge deck.

Benefits

- Conventional falseworks and formworks are not required and therefore extensive temporary road closures/diversions at the interchange can be avoided;
- In-situ concreting works are significantly reduced compared with the other methods, minimizing the potential impacts to the environment, such as noise and air quality. In addition, the operation is quieter compared with other methods;
- Construction time is shorter and better construction planning can be achieved;
- Although not labour intensive as most of the works can be achieved off site. Even so, more experience and mature skilled labourers have been developed in recent years in Hong Kong for this method of construction, and therefore local resources should be readily available.

Drawbacks

- Construction cost is relatively high for an approximately 140m long bridge; and;
- The gantry girder cannot be very long thus restricting the span length to a maximum of around 60m currently in Hong Kong.
- Worldwide specialist contractors may be required.

Option 2: Cast In-situ Deck with Conventional Temporary Works

Falseworks/scaffolding will be erected across the existing carriageway for placement of formworks. Rebar fixing will be subsequently carried out before in-situ concreting of the deck structure.

Benefits

- It is a simple and straight forward construction method;
- Extensive experiences have been gained among the local contractors.

Drawbacks

- Temporary road closure is necessary for erection of falseworks and during concreting, causing significant impacts to the existing traffic;
- Construction time may be taken longer for the span-by-span construction method;
- More working areas are required; and
- More construction plants will be involved for the in-situ works and the longer construction period will induce higher environmental impacts to the surroundings, such as noise and air quality impacts.

Option 3: Cast In-situ Balanced Cantilever Box Girder by Form Travellers

This construction method is a combination of Options 1 and 2. First pair of the box girder segments will be cast in-situ symmetrically about the pier head by conventional falseworks and formworks. Form travellers will be launched and anchored on the previously cast segments for rebar fixing and concreting of the subsequent pair of segments. After stressing the new segments to the deck structure, the travelling formworks will be moved forward and the construction procedures will be repeated until completion of the bridge deck.

Benefits

- Requirements of the conventional falseworks and formworks is greatly reduced; and
- Heavy lifting operations are minimised.

Drawbacks

- It is time consuming for steel fixing, concreting of segments and adjustment of the form travellers as compared with the other two options, causing longer construction period and higher environmental impacts;
- Comparatively, more construction plants will be involved for the in-situ works, which will also induce higher environmental impacts on the surroundings, such as noise and air quality impacts.
- Temporary road closure during day-time cannot be avoided, particularly for concreting above existing carriageway, which cause disturbances to the traffic;
- There is limited experiences for highways construction using form travellers in Hong Kong; and
- Worldwide specialist contractors may be required.

3.3.4 Selection of Construction Method for New Flyover Deck

The potential environmental impacts to the NSRs in the vicinity, disturbance to existing traffic flows and construction speed are all important factors in the selection of a preferred construction method for the new flyover deck. Option 3 is considered to be inferior in all the above aspects, and therefore has not been considered further. Both Options 1 - Precast Segmental Balanced

Cantilever Box Girder and Option 2 - Cast In-situ Deck with Conventional Temporary Works are found to be acceptable in terms of the potential construction noise impacts, as demonstrated in *Section 4*. Option 1 is a common method for the construction of flyovers/viaducts in Hong Kong in recent years, and therefore the required construction equipment should be readily available. Option 1 however has an advantage over Option 2 in its faster construction speed, and therefore helps to reduce the duration of potential environmental impacts arising from the works of the Project. Based on the above, Option 1 has been adopted as the method for deck construction for the purpose of the following environmental assessments but the prospective contractor may still adopt Option 2 where site and traffic conditions allow.

Table 3.3b Comparison of Alternative Construction Methods for New Flyer Deck

Options	Alternative Construction Methods	Benefits	Drawbacks
1	Precast Segmental Balanced Cantilever Box Girder	• Conventional falseworks and formworks are not required and therefore extensive temporary road closures/diversions at the interchange can be avoided; • In-situ concreting works are significantly reduced compared with the other methods, minimizing the potential impacts to the environment, such as noise and air quality; In addition, the operation is quiet compared with other methods. • Construction time is shorter and better construction planning can be achieved; • Although not labour intensive as most of the works can be achieved off site. Even so, more experience and mature skilled labourers have been developed in recent years in Hong Kong for this method of construction, and therefore local resources should be readily available.	• Construction cost is relatively high for an approximately 140m long bridge; • The gantry girder cannot be very long thus restricting the span length to a maximum of around 60m currently in Hong Kong; and • Worldwide specialist contractors may be required.
2	Cast In-situ Deck with Conventional Temporary Works	• It is a simple and straight forward construction method; • Extensive experiences have been gained among the local contractors.	• Temporary road closure is necessary for erection of falseworks and during concreting, causing significant impacts to the existing traffic; • Construction time may be taken longer for the span-by-span construction method; • More working areas are required; and • More construction plants will be involved for the in-situ works and the longer construction period will induce higher environmental impacts to the surroundings, such as noise and air quality impacts.

Options	Alternative Construction Methods	Benefits	Drawbacks
3	Cast In-situ Balanced Cantilever Box Girder by Form Travellers	• Requirements of the conventional falseworks and formworks is greatly reduced; and • Heavy lifting operations are minimised.	• It is time consuming for steel fixing, concreting of segments and adjustment of the form travellers as compared with the other two options, causing longer construction period and higher environmental impacts; • Comparatively, more construction plants will be involved for the in-situ works, which will also induce higher environmental impacts on the surroundings, such as noise and air quality impacts; • Temporary road closure during day-time can not be avoided, particularly for concreting above existing carriageway, which cause disturbances to the traffic; • There is limited experiences for highways construction using form travellers in Hong Kong; and • Worldwide specialist contractors may be required.

3.3.5 Options for Construction of Retaining Structures

Three types of retaining structures are considered for the formation of road embankments, namely reinforced concrete (RC) cantilever wall, piled wall and reinforced earth (RE) wall. As these are widely adopted as solutions for retaining structures in Hong Kong in recent years, the required machinery should be available during construction.

Construction of RC cantilever walls involves excavation, formwork erection, rebar fixing, placing of wall drainage system, in-situ concreting, temporary works removal and backfilling of the walls. It is a relatively straight forward construction method and extensive project experiences have been gained in Hong Kong.

Piled wall utilizes the lateral resistance of the piles for earth retaining purpose. It is commonly used in areas where excavation for RC wall construction is difficult or technically infeasible. Piled wall construction involves pile shaft excavation using piling plants, placing of rebar cages/H-piles, in-situ shaft concreting/grouting, excavation and construction of lagging between piles. The retained height would generally be higher than the RC wall, and excavation works would be much less. However, pile installation usually induces noise and vibration with higher degree of environmental concerns. Moreover, for the works immediately adjacent to the existing carriageways, temporary road closure or traffic diversion may be required to provide larger working spaces required for the piling plants.

Construction works for RE wall comprises excavation, and placing of fill materials and reinforcements in compacted backfill layers until the design road formation level is reached. The construction sequences are relatively simple and construction rate is usually faster than the conventional RC retaining wall construction. Experiences in the use of RE wall have been gained in recent years to form embankment slopes for highway projects in Hong Kong. Moreover, this wall structure is flexible and can accommodate higher differential settlement that is particularly suitable for the Project site, which has the presence of compressible layers. From environmental point of view, the construction method comparatively generates less noise, and consumes less energy.

By comparing the above three construction method of retaining structures, it is considered that the RE wall option is more preferable in terms of environmental consideration, construction speed and flexibility. However, RC cantilever walls at some areas are still required due to small retaining height required or site constraints, such as tie-in issues with the proposed/existing RC structures.

In conclusion, the optimum solution of retaining structures is provision of RE walls, associated with RC walls, where appropriate.

3.3.6 Consideration of Construction Sequences

The interchange improvement works are broadly grouped into three main tasks as follows:

Task 1: Provision of southbound carriageways, including construction works for Road Resurfacing & Remarking A, Left-turn Lane A and Slip Road C; and

Task 2: Provision of northbound carriageways, including construction works for Slip Roads A and B, new flyover and Road Resurfacing & Remarking B.

Task 3: Earmark an approximate 200m long and 2.5m high vertical noise barrier along the southern arm of the northbound carriageway of Yuen Long Highway to the east of the planned schools (refer to *Annex C11-2* for noise barrier location).

Overall Planning

Task 2 is scheduled to start following the commencement of Task 1 for alleviating the cumulative environmental impacts to the surroundings and to enable early handover of the carriageway.

Construction sequences are also highly dependent on the selection of construction methods. Consideration of different construction methods for piling works, erection of the new flyover deck and retaining walls has already been discussed in above sections. However, one of key approaches is to maximize the use of pre-cast units, and therefore minimise in-situ works and the consequential environmental impacts on the Project site. Other preferences in the construction methods include fast construction progress and the use of relatively silent plant.

Construction Works for Task 1

The existing alignment of the Road Resurfacing & Remarking A is to be locally adjusted to increase the number of carriageway lanes from three to four. Works include resurfacing of the existing carriageway and reprovision of road markings.

Left-turn Lane A construction includes dismantling of the existing noise barrier, construction of a subway extension, and integrated planter and retaining structures, formation of fill embankment slopes, construction of pavement and the associated drainage, watermain, utilities and landscaping works.

Construction of Slip Road C involves retaining walls construction, re-profiling of the existing fill embankment slopes, construction of pavement and the associated drainage, watermain, utilities and landscaping works.

As shown on the construction programme in *Annex C2*, it is anticipated that construction of Task 1 will take around one and half year. Other than the construction methods and sequences described above, there are limited

alternatives due to the relatively straight-forward works sequences and the tight construction programme.

Construction Works for Task 2

Construction of the new flyover involves pile installations, construction of pilecaps and piers/columns, erection of deck, installation of parapets and planters, pavement works and the associated drainage, watermain, utilities and landscaping works.

Similar to the construction of Slip Road C, works for Slip Roads A and B comprise construction of retaining walls or formation fill embankment slopes, installation of parapets, construction of pavement and the associated drainage, watermain, utilities and landscaping works.

The existing alignment of Road Resurfacing & Remarking B is to be slightly shifted westward to accommodate the additional lane at the northbound carriageway. Works mainly consist of road formation and re-surfacing, and reprovision of existing drainage and road furniture along the realigned carriageway.

Noise induced from piling works is one of the major concerns; construction works for Slip Roads A and B are therefore planned to commence after the completion of the pile installation works. Moreover, pavement construction of Slip Roads A and B, the new flyover and Road Resurfacing & Remarking B is planned to be conducted in a similar period so that paving of the southbound carriageway can be carried out within the same time frame. Consequently, it can reduce the numbers of overlapping joints and mobilization of construction plants. In addition, it can mitigate the overall level of disturbance to the environment and traffic.

Construction Works for Task 3

Construction of the proposed noise barrier will be earmarked as a provisional work of the Project as the construction schedule of the planned schools has not yet been confirmed. Moreover, it is anticipated that the noise barrier will be designed in form of a retaining structure with an extended wall plinth for the noise barrier. Therefore, construction of the noise barrier will involve site formation, retaining wall construction, backfilling works and reinstatement of the existing street furniture. Furthermore, the noise barrier will be positioned at the crest of existing fill embankment slope of Yuen Long Highway, and therefore re-profiling /reinstatement of the existing fill slopes may be required during the noise barrier construction.

4 NOISE

4.1 INTRODUCTION

This *Section* assesses the potential noise impacts associated with the construction and operation of the Project.

4.2 RELEVANT LEGISLATION AND GUIDELINES

4.2.1 Construction Noise

The principal legislation relating to the control of construction noise is the *Environmental Impact Assessment Ordinance* (*EIAO*) (Cap. 499). The *Technical Memorandum on Environmental Impact Assessment Process* (*EIAO-TM*), issued under the *EIAO*, provides guidelines and noise criteria for evaluating the noise impact.

The *Noise Control Ordinance (Cap. 400)* (*NCO*) also provides means to assess the construction noise impact. Various Technical Memoranda (TMs), which stipulate control approaches and criteria, have been issued under the *NCO*. The following TMs are applicable to the control of noise impact from construction activities:

- *Technical Memorandum on Noise from Construction Work other than Percussive Piling* (*GW-TM*); and
- *Technical Memorandum on Noise from Construction Work in Designated Areas* (*DA-TM*).

General Construction Works

Under the *EIAO*, potential noise impact arising from general construction works during normal working hours (ie 07:00 to 19:00 hrs on any day not being a Sunday or public holiday) at 1 m from the external façade of the uses, which rely on opened windows for ventilation, is to be assessed in accordance with the noise criteria specified in the *EIAO-TM*. The *EIAO-TM* noise standards are presented in *Table 4.2a*.

Table 4.2a EIAO-TM Day-time Construction Noise Standards ($L_{eq,\ 30\ min}$ dB(A))

Use	Noise Standard (dB(A))
Domestic Premises	75
Educational Institutions (normal periods)	70
Educational Institutions (during examination periods)	65

Notes:

(1) The above standards apply to uses which reply on opened windows for ventilation.

(2) The above standards shall be viewed as the maximum permissible noise levels assessed at 1m from the external façade.

When assessing a Construction Noise Permit (CNP) application for the use of Powered Mechanical Equipment (PME) during the restricted hours, the Noise Control Authority will compare the Acceptable Noise Levels (ANLs), as promulgated in *GW-TM*, and the Corrected Noise Levels (CNLs) (ie after accounting for factors such as barrier effects and reflections) associated with the proposed PME operations. The ANLs are obtained with corrections for the duration of the CNP and multiple permit situations, if applicable, to the Basic Noise Levels (BNLs). The BNLs are related to the noise sensitivity of the area in question and different Area Sensitivity Ratings (ASR) have been established to reflect the background characteristics of different areas. The appropriate ASR for the Noise Sensitive Receiver (NSR) is determined with reference to *Table 4.2b*.

Table 4.2b ***Area Sensitivity Ratings***

Types of Area Containing NSR	**Degree to which NSR is affected by Influencing Factor (IF)**		
	Not Affected	**Indirectly Affected**	**Directly Affected**
Rural area, including Country Parks or village type developments	A	B	B
Low density residential area consisting of low-rise or isolated high-rise developments	A	B	C
Urban area	B	C	C
Area other than those above	B	B	C

Notes:

The following definitions apply:

(a) "Country Park" means an area that is designated as a country park pursuant to section 14 of the *Country Parks Ordinance*;

(b) "directly affected" means that the NSR is at such a location that noise generated by the IF is readily noticeable at the NSR and is a dominant feature of the noise climate of the NSR;

(c) "indirectly affected" means that the NSR is at such a location that noise generated by the IF, whilst noticeable at the NSR, is not a dominant feature of the noise climate of the NSR;

(d) "not affected" means that the NSR is at such a location that noise generated by the IF is not noticeable at the NSR; and

(e) "urban area" means an area of high density, diverse development including a mixture of such elements as industrial activities, major trade or commercial activities and residential premises.

The relevant BNLs are shown in *Table 4.2c*.

Table 4.2c ***Basic Noise Levels for General Construction Works (BNL, $L_{eq,\ 5\ min}$ dB(A))***

Time period	**Area Sensitivity Rating (dB(A))**		
	A	B	C
All days during the evening (ie 19:00-23:00 hrs) and general holidays (including Sundays) during the day and evening (ie 07:00-23:00 hrs)	60	65	70
All days during the night-time (ie 23:00-07:00 hrs)	45	50	55

The Noise Control Authority will consider a well-justified CNP application, for construction works within restricted hours as guided by the relevant TMs issued under the *NCO*. The Noise Control Authority will take into account

adjoining land uses and any previous complaints against construction activities at the site before making a decision. Nothing in this *EIA Report* shall bind the Noise Control Authority in making its decision. The Noise Control Authority may include any conditions in a CNP that it considers appropriate. Failure to comply with any such conditions may lead to cancellation of the CNP and prosecution action under the *NCO*.

4.2.2 Operational Road Traffic Noise

The traffic noise standards for planning purposes specified in Table 1 under Annex 5 of the *EIAO-TM* were employed as the noise limits for the road traffic noise impact assessment. The applicable road traffic noise standards are presented in *Table 4.2d*.

Table 4.2d EIAO-TM Road Traffic Noise Standards ($L_{10,\ 1\ hour}$ dB(A))

Use	Noise Standard (dB(A))
Domestic Premises	70
Educational Institutions	65
Hospitals and Homes for the Aged	55

Notes:

(1) The above standards apply to uses which reply on opened windows for ventilation.

(2) The above standards shall be viewed as the maximum permissible noise levels assessed at 1m from the external façade.

For traffic noise assessment, the major roads within 300 m of the Project boundary have been included in the assessment.

The traffic noise impact is considered significant if the traffic noise level at the Noise Sensitive Receivers (NSRs) with the road project is greater than that without the road project at the design year by 1.0 dB(A) or more.

The noise level due to the traffic on the Project should not exceed the criteria as presented in *Table 4.2d* by 1.0 dB(A).

In the case where noise prediction results show NSRs still exposed to noise levels exceeding the relevant noise criteria after the implementation of all direct mitigation measures, the total number of existing dwellings, classrooms and other noise sensitive elements which may qualify for indirect technical remedies, the associated costs and any implications for such implementation should be identified and estimated. The eligibility of the affected premises for indirect technical remedies will be determined with reference to the following three criteria:

- The predicted overall noise level at the NSR from the Project together with other traffic noise in the vicinity must be above the noise criteria presented in *Table 4.2d*;

- The predicted overall noise level at the NSR is at least 1.0 dB(A) more than the prevailing traffic noise level, ie, the total traffic noise level existing before the works to construct the road were commenced; and

- The contribution from the Project to the increase in predicted overall noise level at the NSR must be at least 1.0 dB(A).

4.3 BASELINE ENVIRONMENTAL CONDITIONS AND NOISE SENSITIVE RECEIVERS

4.3.1 Baseline Environmental Conditions

The Study Area is generally rural in nature, with the surrounding land comprising scattered village houses, school, hospital, home of the aged, new high-rise residential developments, and unoccupied open spaces. In accordance with the Outline Zoning Plans (OZP) for Yuen Long (No.S/YL/17), Nam Sang Wai (No.S/YL-NSW/8) and Tai Tong (No.S/YL-TT/14), the land uses of the surrounding areas were zoned as "Open Space" (O), "Government/Institution/Community" (GIC), "Comprehensive Development Area" (CDA), "Village Type Development" (V), "Undetermined" (U) and "Agriculture" (AGR) (*Figures 4.3a* to *4.3c*).

The environment of the Study Area is already subject to a high level road traffic noise. The existing traffic noise sources are mainly the traffic on the Yuen Long Highway, Pok Oi Roundabout and Castle Peak Road – Yuen Long Section. Noise barriers were installed for parts of the existing Yuen Long Highway within the Study Area to protect the NSRs in the vicinity, in particular the low-rise village houses at Wong Uk Tsuen and Small Traders New Village.

4.3.2 Noise Sensitive Receivers

In accordance with the requirements stated in Section 3.4.1.2 of the *EIA Study Brief*, the Study Area for the noise impact assessment covered a distance of 300m from the boundary of the Project. Only the first layer of the NSRs located along Yuen Long Highway were included in the assessment as the NSRs behind were located further away from the road and were screened. The area considered in the assessment is shown in *Figure 4.3d*.

The selected existing representative NSRs that may potentially be affected by the construction and operation of the Project include Wong Uk Tsuen, Small Traders New Village, Chuk San Tsuen, Hoover Garden and village houses along Yuen Long Highway, the high-rise residential development at YOHO Town, Kwong Ming Ying Loi School (an educational institution), and Jockey Club Care and Attention Home (a home for the aged).

In accordance with the OZPs for Yuen Long, Nam San Wai and Tai Tong referenced above, the areas immediately east of the Yuen Long Highway are zoned as "Undetermined" (U) and "Agriculture" (AGR), the areas immediately to the west of the Yuen Long Highway are zoned as "Open

Space" (O), "Government/Institution/Community" (GIC), "Comprehensive Development Area" (CDA) and "Village Type Development" (V).

Site visits to Pok Oi Hospital and Jockey Club Care and Attention Home were carried out on 18 January 2008. According to the management of Pok Oi Hospital, central air-conditioning system was provided to the hospital and there was no staff quarters within the hospital. Pok Oi Hospital therefore does not rely on openable windows for ventilation as shown in the written confirmation from the Hospital in *Annex C1*. As observed during the site visit and confirmed by the floor plans provided by the management of Jockey Club Care and Attention Home, the rooms facing Yuen Long Highway were bedrooms and therapy rooms installed with window-type air-conditioners and openable windows. Some of the windows were found to be opened during the site visit. As a result, Pok Oi Hospital was not identified as NSR, but the Jockey Club Care and Attention Home was identified as NSR.

Planning Department (PlanD) and Lands Department (LandsD) were consulted on the land use planning for the nearby areas. LandsD confirmed that there is no planned development within the nearby three zones, including the "Village" zone in which Wong Uk Tsuen is located, the "Undetermined" zone in which Small Trade New Village is located and the "Agricultural" zone in which scattered village houses are located.

Based on the information provided by the PlanD, residential developments were planned within the CDA zones, including Yuen Long Area 12 and Area 15, an Indoor Recreational Centre & Combined Wholesale Food Market and two educational institutions were planned within the GIC zone. However, there are no proposed layouts available for the Indoor Recreational Centre & Combined Wholesale Food Market and the two educational institutions. As the food market is not noise sensitive and the indoor recreation centre will likely be installed with central air-conditioning system and fixed glazing (thereby eliminating its reliance on openable windows for ventilation), they were not identified as NSR.

Information from PlanD indicated that there are a number of schemes approved and remain valid for the CDA zones, Yuen Long Area 12 and Area 15. Assessment points were included in the traffic noise impact assessment at the boundary of the CDA zones with 180 degrees view angle facing Yuen Long Highway and the POR. Taken into account the presence of a drainage reserve, which is a non-building area, along the eastern and southeastern lot boundaries of Area 15 facing Yuen Long Highway and Castle Peak Road, assessment points were set back to exclude this non-building area.

PlanD also confirmed that a Planning Application for Residential Development with Preservation of Pun Uk (No. A/YL-NSW/15) had expired. New scheme layout was received recently but formal Planning Application was not received by PlanD. As the approved scheme under No. A/YL-NSW/15 is the best information available, the assessment was undertaken based on this scheme, as shown in *Annex C1*, to assess the noise impact for all potential NSRs.

Yuen Long Small Traders New Village Public School was located at Small Traders New Village, but it was ceased operation. Based on the information provided by the Education Bureau in *Annex C1*, the existing school building is planned for non-school educational use with minor fitting-out works. Assessment was therefore undertaken based on the existing school building.

The locations of the identified representative existing and planned NSRs, and photographs showing the existing NSRs are presented in *Figure 4.3e*.

Descriptions of the representative NSRs and the separation distances between the NSRs and the Project are provided in *Table 4.3a*.

Notes:

(a) The ground floor of this NSR is a lobby with plant rooms, ie not noise-sensitive.
(b) Planned NSRs for operational noise impact assessment only.
(c) Not available for planned development.

4.4 *ASSESSMENT METHODOLOGY*

4.4.1 *Construction Phase*

The construction noise impact assessment was undertaken in accordance with the procedures outlined in the *GW-TM,* which is issued under the *NCO* and the *EIAO-TM*. The assessment methodology is summarised as follows:

- Locate representative NSRs that may be affected by the Project;
- Determine the plant teams for corresponding activities, based on the agreed plant inventory;
- Assign sound power levels (SWLs) to the Powered Mechanical Equipment (PME) proposed based on the *GW-TM*, *British Standard BS 5228*[(1)] and list of SWLs of other commonly used PME[(2)];
- Calculate the correction factors based on the distance between the NSRs and the notional noise source position of the work sites;
- Apply corrections in the calculations, such as potential screening effects and acoustic reflection, if any; and
- Predict the construction noise levels at NSRs in the absence of any mitigation measures.

The construction noise assessment was undertaken based on the proposed construction works programme and plant inventory presented in *Annexes C2* and *C3*. The Project Proponent has reviewed the programme and plant inventory, and has confirmed that they are reasonable and practicable for completing the Project within the scheduled timeframe. The proposed methods for the construction of the Project are common in Hong Kong and the PMEs proposed are available in the Hong Kong market. For example, the

(1) British Standard "Noise and Vibration Control on Construction and Open Sites – Part I", BS 5228: Part I

(2) "Sound power levels of other commonly used PME" prepared by the Noise Control Authority (http://www.epd.gov.hk/epd/english/application_for_licences/guidance/files/OtherSWLe.pdf)

piles of the existing Yuen Long Highway flyover were also installed by CFA machine.

The total SWL associated with each construction activity was established. Owing to the small construction work sites involved in the Project, the construction noise levels at NSRs were calculated based on the distances between the respective NSRs and their nearest site boundaries. The potential noise impacts at NSRs were subsequently evaluated by comparing the predicted noise levels with the *EIAO-TM* day-time construction noise limits ($L_{eq, 30min}$ dB(A)), as outlined in *Section 4.2.1*.

4.4.2 Operational Phase

The road traffic noise impact assessment due to the improvement to POI was based on the procedures given in *Calculation of Road Traffic Noise* (*CRTN*) published by the UK Department of Transport. The assessment has been undertaken for the scenarios of with and without the Project during the peak hour in respect of the maximum traffic projections within a 15 year period following the commencement of the operation of the Project. The AM peak hour traffic flow for Year 2026 was considered to be the maximum traffic forecast during the period 2011 to 2026, and therefore was adopted for the assessment (*Annex B*). The traffic forecast employed for this assessment was endorsed by Transport Department (TD) (*Annex B*).

The road surface types and speed limits for the road sections in the Project are indicated in *Annex B*. The design information of the proposed roads in *Table 4.4a* was agreed by TD:

Table 4.4a Design Information of the Proposed Roads

Proposed Roads	Road Type	Road Speed (kph)	Road Surface
Flyover A	Rural Trunk Road	70kph	Low Noise Surface
Slip Road A	Rural Trunk Road	50 - 70kph	Bitumen & Low Noise Surface
Slip Road B	Expressway	70 - 80kph	Low Noise Surface
Slip Road C	Rural Trunk Road	50kph	Bitumen
Segregated Left-turn Lane A	Rural Trunk Road	50kph	Bitumen

Based on the as-built drawings provided by HyD, absorptive noise barriers of 1m to 3.5 m in height were erected along the road edges of the existing Yuen Long Highway Flyover. Noise barriers of 0.8m to 4m height were also erected along the road edges of the existing slip roads on the northern arm of Yuen Long Highway. These noise barriers have been included in the noise model and their locations are presented in *Annex C*.

Some sections of the existing noise barriers will have to be demolished for the construction of the Project, which are presented in *Annex C5*. The existing 0.8m and 2m noise barriers at the POR will be demolished after the completion of the new segregated left-turn lane and its associated planter wall. A short section of the existing 3m high noise barrier will be required to setback for about 2m to allow bus sight-line for the new segregated left-turn

lane. This section of noise barrier will be taken out in the noise model for the Project (without mitigation) to represent a worse-case scenario.

In accordance with the policy and requirements set out in the *Technical Circular (Works) No. 10/2005* for *Planting on Footbridges and Flyovers* published by the then Environmental, Transport and Works Bureau, planters will be provided for the new flyover. In addition to the planters, a 1.1m high concrete parapet wall along the road sides of the new flyover and a 1.5m high planter wall along the new segregated left-turn lane will be provided following the requirements of typical highway engineering design to form part of the road works. These provisions are incorporated in the noise assessment. Indicative sections of the proposed concrete parapet wall and the planter wall are presented in *Annex C6*.

The predicted noise levels due to the Project were evaluated by comparison with the *EIAO-TM* traffic noise limits ($L_{10, 1hr}$ dB(A)), as outlined in *Section 4.2.2*.

4.5 IDENTIFICATION OF POTENTIAL IMPACTS

4.5.1 Construction Phase

Noise arising from the construction activities of the Project will likely have potential noise impacts on the nearby NSRs if unmitigated. The major activities associated with the construction phase will involve the use of PME and they are summarised as follows:

- Site clearance and site formation;
- Road drainage, utilities and water main works;
- Demolition of existing structures;
- Piling by Continuous Flight Auger (CFA);
- Construction of retaining walls and abutments by silent piler;
- Subway extension;
- Construction of pilecaps and piers;
- Construction of new flyover by balanced cantilever precast;
- Installation of concrete parapets and planters; and
- Pavement construction.

It is anticipated that percussive piling will not be required. The normal working hours of the Contractor will be between 07:00 and 19:00 hours from Monday to Saturday (except public holidays). For construction method Option 1, ie precast segment balanced cantilever box girder, is adopted for the

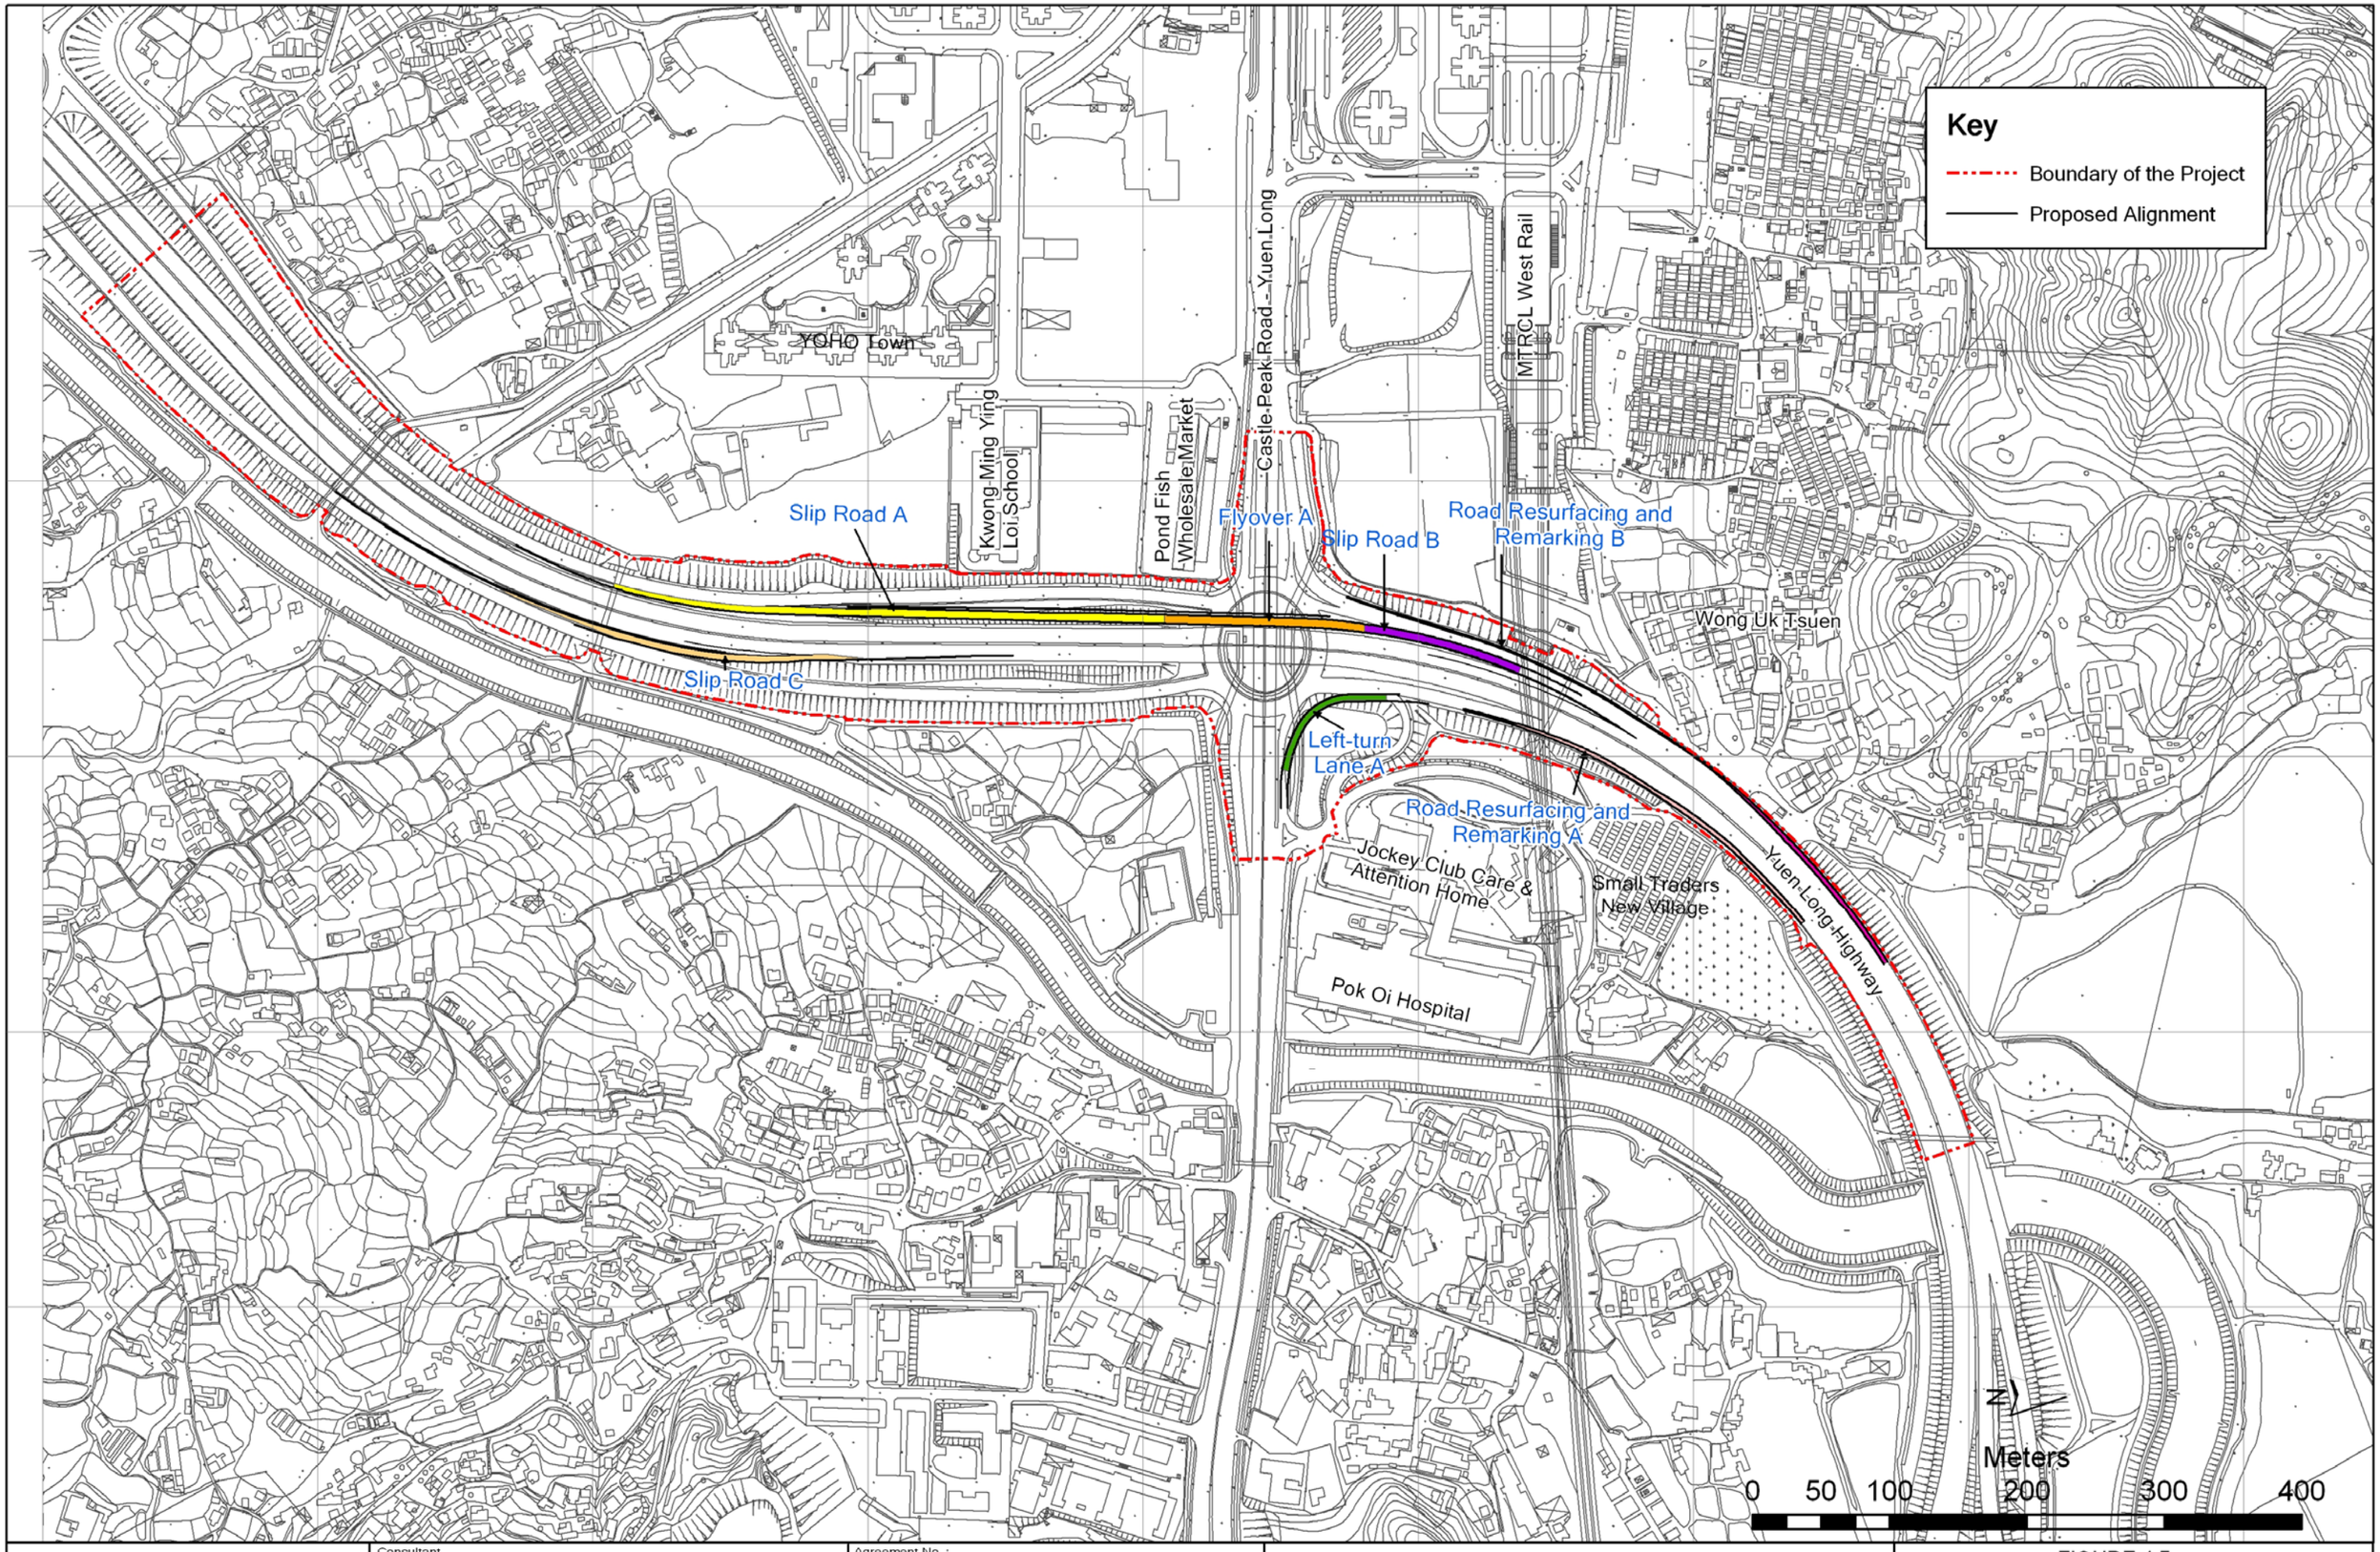
new flyover deck, construction activities during night-time, which is within the restricted hours under the NCO, are expected for the installation of precast concrete segments and the erection of sign gantry to avoid disruption of traffic on the existing roads during daytime and to ensure that the launching of precast segments over busy road sections will not jeopardise road safety. During the detailed design and the construction of the Project, every effort will be made to streamline the work cycle for the flyover deck construction to minimise the requirement for work activities within the restricted hours. If construction method Option 2, ie cast in-situ deck with conventional temporary works, is adopted, two additional months will be required for constructing the new flyover and the construction programme will be revised as shown in *Annex C2*. *Figure 4.5a* indicates the location of work areas.

For construction works planned during the restricted hours, it will be the responsibility of the Contractor to ensure compliance with the *NCO* and the relevant TMs. In such cases, the Contractor will be required to submit a CNP application to the Noise Control Authority and abide by any conditions stated in the CNP, should one be issued. There is no guarantee that a CNP will be issued for the Project construction. The Noise Control Authority will consider a well-justified CNP application, once filed, for construction works within restricted hours as guided by the relevant TMs issued under the NCO. The Noise Control Authority will take into account of contemporary conditions/situations of adjoining land uses and any previous complaints against construction activities at the site before making his decision in granting a CNP. Nothing in this report shall bind EPD in making its decision. If a permit is to be issued, EPD will include any conditions considered appropriate and such conditions are to be followed while the works covered by the permit are being carried out. Failure to comply with the conditions stipulated will lead to cancellation of the permit and prosecution action under the *NCO*.

As indicated in *Section 2.3*, the Project may interact with the following concurrent projects:

- Kau Hui Development - Engineering Works in Area 16, Yuen Long Phase 2 - Extension of Road L3 (Project No. 7721CL/B): The proposed project is for the extension of Road L3 in Yuen Long Area 16 located next to the West Rail Yuen Long Station. The scope of the project mainly comprises the extension of an exiting carriageway by about 220m and its associated drainage and landscape works. The construction period will commence in August 2008 and end in 2011.

- Proposed Left Turn Lane at Pok Oi Interchange for the Development at YOHO Town Phase II: An exclusive left turn lane in Pok Oi Interchange will be constructed by Sun Hung Kai Properties Ltd. together with the private development YOHO Town Phase II. The exclusive left turn lane will be located in the south-west corner of the interchange, ie, for vehicles from Shap Pat Heung Interchange to Yuen Long Town. The construction period is about 1 year. The works will be completed on or before 2010.



Highways Department The Government of the Hong Kong Special Administrative Region	Consultant Environmental Resources Managment ERM Halcrow Halcrow China Ltd. As Engineering Sub-consultant	Agreement No. : WD 6/2007	Environmental Impact Assessment Report	FIGURE 4.5a

0072252_nightwork_revised.mxd

The locations of concurrent projects within 300m of the study area are indicated in *Figure 2.5a*. The construction programme and plant inventory for the above-mentioned concurrent projects are not available at this stage. Cumulative noise impacts were assessed based on an assumed typical plant inventory for small scale road works.

4.5.2 Operational Phase

The objective of the Project is to relieve the traffic pressure and traffic queues of the existing POR by means of the flyover, slip roads, segregated left-turn lane and the associated works. During the operation of the Project, it may increase the road traffic noise impacts on the nearby NSRs. Practical direct noise mitigation measures will be recommended, if necessary, to alleviate the potential noise impact.

4.6 EVALUATION OF IMPACTS

4.6.1 Construction Phase

The predicted construction noise levels during daytime periods for construction method for flyover A Options 1 and 2 are presented in *Tables 4.6a* and *4.6b*, respectively. Details of the noise calculations are presented in *Annex C7*.

Table 4.6a Predicted Construction Noise Levels during Daytime Period (Without Mitigation) (Construction Method for Flayover A - Option 1 : Precast Segment Balanced Centilever Box Girder)

STNV1	Small Traders New Village	65 - **78**	66 - **79**	75
V1	Village houses facing slip road (south bound) of Yuen Long Highway - south of POI	64 – 74	64 – 74	75
V2		64 - **76**	64 - **76**	75
V3	Chuk San Tsuen	53 – **76**	53 – **76**	75
V6	Hoover Garden	57 – 70	57 – 70	75
WUT1	Wong Uk Tsuen	65 – **78**	68 – **81**	75
YT1	YOHO Town Phase I	62 - 71	62 - 71	75

Notes:
(a) All predicted noise levels were corrected with 3dB(A) for façade reflection.
(b) **Bold** value indicates exceedance of noise criteria of 75 dB(A) for residential premises, 70 dB(A) for educational institutions during daytime period.

The results indicate that the construction noise impacts at most of the NSRs exceeded the *EIAO-TM* noise criteria during daytime period. Mitigation measures will therefore be required to mitigate the construction noise impact.

4.6.2 Operational Phase

Designated Project Analysis

Road traffic noise levels have been predicted at a total of 21 representative NSR locations, including existing and planned uses. *Annex C8* presents the breakdown of the noise levels with and without the Project. The results indicate that the traffic noise level with the road project is not greater than that

without the road project at the design year by 1.0dB(A) or more at any of the NSRs and will not result in any adverse impact on the NSRs. The Project as a whole will not constitute any material change on the noise front to exempted projects. Hence, it is not required to consider noise mitigation measures in the context of the whole project boundary to reduce the traffic noise impacts at all NSRs to meet the *EIAO-TM* noise criteria.

Road Traffic Noise

Without noise mitigation measures in place, the predicted noise levels at the representative NSRs were in the range of 58 to 83 dB(A) with the Project. Results indicated that the predicted noise levels exceeded the traffic noise criteria due to the Project and other existing roads at the planned NSR PS1, while exceedance predicted at other NSRs would be due to other existing roads only. Noise mitigation measures for the two planned schools are required to alleviate the adverse traffic noise impact.

Detailed results of the road traffic noise impact assessment with the road plots and input files are presented in *Annex C9*.

4.7 MITIGATION OF ADVERSE ENVIRONMENTAL IMPACTS

4.7.1 Construction Phase

In view of the predicted noise exceedances during the construction of the Project, the following mitigation measures have been considered:

- Good Site Practice;
- Use of quiet PME;
- Use of acoustic enclosure;
- Adoption of movable noise barriers; and
- Scheduling of PME/Construction Activities.

Good Site Practices

Good site practices and noise management can considerably reduce the impact of construction site activities on nearby NSRs. The noise benefits of these practices can vary according to specific site conditions and operations. Since the effect of the good site practices could not be quantified, the mitigated noise levels calculated in the subsequent sections have not taken account of this effect. The following site practices should be followed during the construction of the Project:

- Only well-maintained plant should be operated on-site and plant should be serviced regularly during the construction program;

- Silencers or mufflers on construction equipment should be utilized and should be properly maintained during the construction program;
- Mobile plant, if any, should be sited as far away from NSRs as possible;
- Machines and plant (such as trucks) that may be in intermittent use should be shut down between work periods or should be throttled down to a minimum;
- Plant known to emit noise strongly in one direction should, wherever possible, be orientated so that the noise is directed away from the nearby NSRs;
- Material stockpiles and other structures should be effectively utilised, wherever practicable, in screening noise from on-site construction activities; and
- The contractor should liaise with the school regarding the examination periods. Noisy construction activities, including piling, excavation and earth-breaking works, will be carried out outside the examination periods.

Use of Quiet PME

The use of quiet PME was considered to be a practicable means to mitigate the construction noise impact. Quiet plant is defined as a PME having actual SWL lower than the value specified in the GW-TM. Quiet PME that have been adopted in the assessment are summarised in *Table 4.7a*.

Table 4.7a Sound Power Level of Quiet PME

PME Item	BS 5228 / EPD QPME Reference	Sound Power Level, dB(A)
Excavator	BS C3/97	105
Mobile crane	BS C7/114	101
Concrete truck	BS C6/23	100
Road roller	BS C8/30	101
Vibratory poker	BS C6/40	98
Asphalt paver	BS C8/24	101
Vibratory roller	BS C3/115	102
Concrete pump	BS C6/36	106
Excavator	EPD 00057	103

Use of Acoustic Enclosure

Temporary acoustic enclosure is a common and effective means to mitigate the noise impact arising from operation of certain small size PMEs. A frame covered with noise insulation materials (sound insulation materials with a superficial surface density of at least 7 kg/m^2 or sound absorbing materials of at least 50mm and average absorption coefficient between 125 Hz and 4000 Hz of 0.4) could at least 5 dB(A) reduction for plant items such as hand-held

breaker and circular wood saw. The locations of the temporary acoustic enclosure shall be adjusted wherever and whenever necessary to protect the noise sensitive receivers, the enclosures shall have no openings or gaps.

Adoption of Movable Noise Barriers

The use of noise barriers will be an effective means to mitigate the noise impact arising from the construction works, particularly for low-rise NSRs. Movable noise barriers of 3 m in height with skid footing should be used and located within a few metres of stationary plant and mobile plant such that the line of sight to the NSR is blocked by the barriers. The length of the barrier should be at least five times greater than its height. It is anticipated that the major noise source of all PMEs, including movable and large PMEs, will be located at a level lower than the top of the proposed movable barriers, and therefore these barriers could produce at least a 5 dB(A) noise reduction for mobile plant such as excavator and roller as well as large scale plant such as a crane. With reference to *A Practical Guide for the Reduction of Noise from Construction Works*, the noise barrier material should have a superficial surface density of at least 7 kg/m^2 and have no openings or gaps. *Figure 4.7a* shows the approximate locations of the proposed movable noise barriers for the construction of slip road A facing Kwong Ming Ying Loi School (NSR KMYLS1).

Scheduling of PME/Construction Activities

In view of the limited separation distance between NSRs KMYLS1 and KMYLS2 and the nearest work sites at slip road A as well as flyover A, the predicted noise level will still exceed the noise criteria. For NSR KMYLS1, exceedance of 2 dB(A) during normal teaching period and 7 dB(A) during examination period is anticipated. For NSR KMYLS2, the predicted noise level complies with the noise criteria of 70 dB(A) during normal teaching period. It will however exceed the noise criteria for examination period by 5 dB(A). Practical mitigation measures with the use of quiet PMEs and movable noise barriers have been exhausted, taking into account the engineering and programming point of view. To further alleviate the construction noise impacts, only one group of PME (Group A or B) will be operated during road drainage, utilities and water mains works at work site of slip road A (*Annex C10*). The predicted noise level at NSRs KMYLS1 and KMYLS2 would comply with the criterion of 70 dB(A) during normal teaching period. It is recommended to cease all construction activities at the work sites of slip road A and flyover A during examination period.

Similar to the situation for NSRs KMYLS1 and KMYLS2, NSRs STNV1 and WUT1 are located within a small distance from the nearest work site for road resurfacing and remarking A and B respectively. The predicted noise level will still exceed the noise criteria of 75 dB(A) by 1 dB(A). Apart from the use of quiet PME, it is proposed that only one group of PME (either Group A or Group B) should be operated during the works within the respective work sites of road resurfacing and remarking A and B. The predicted noise level at

NSR STNV1 and WUT1 would comply the relevant noise criteria. The detailed calculations are presented in *Annex C10*.

The above mitigation measures have been vetted and confirmed by the Project Proponent as being practicable in completing the works within the scheduled timeframe. It is considered practical to specify the total SWL of all plant items to be used on-site so that flexibility is allowed for the Contractor to select plant items to suit the construction needs.

With the implementation of the use of quiet PME, movable noise barriers and scheduling of construction works for various construction activities as shown in *Annex C10*, the mitigated noise levels at the representative NSRs were calculated and the results for daytime periods for construction method Options 1 and 2 for new flyover deck are summarised in *Tables 4.7b* and *4.7c*, respectively.

Table 4.7b ***Predicted Construction Noise Levels during Daytime Period (With Mitigation) (Construction Method for Flayover A - Option 1 : Precast Segment Balanced Centilever Box Girder)***

YT1	YOHO Town Phase I	57 – 64	64 – 64	75

Note:
(a) All predicted noise levels were corrected with 3dB(A) for façade reflection.

The results indicate that with the adoption of the recommended mitigation measures, no exceedance of the *EIAO-TM* noise criteria during the daytime period is anticipated. No further mitigation will therefore be required.

For the proposed noise barrier to mitigate the traffic noise impact on the planned schools due to the Project, it will only be constructed when there is an implementation programme for the construction of the planned schools. The construction noise impact was estimated at the nearest NSRs KMYLS1, KMYLS2 and YT1. With the use of quiet PME and movable noise barriers, in conjunction with careful scheduling of works, the predicted noise levels at the NSRs are anticipated to comply with the *EIAO-TM* daytime noise criteria for residential premises and education institutions during normal teaching period. Details of the calculations are given in *Annex C10*. It is recommended to cease all noisy construction activities at the work site of slip road A and flyover A during examination periods.

4.7.2 Operational Phase

With the results of the prediction indicated noise exceedance at the planned NSR PS1 due to both the Project and other existing roads, direct mitigation measure would be required to reduce the noise from the Project to a level that it:

- is not higher than the *EIAO-TM* noise criteria; and

- has no significant contribution to the overall noise from other existing roads, if the cumulative noise level (i.e. noise from the Project together with other existing roads) exceeds the *EIAO-TM* noise criteria.

The following direct mitigation measure has been proposed:

- A section of approximately 200m long 2.5m high vertical barrier along the northern bound of Yuen Long Highway in front of the planned schools within the CDA zone. The barrier is proposed to be concrete structures installed with reflective barrier panels to align with the visual appearance of the existing noise-screening structures provided along Yuen Long Highway. As this section of barrier was proposed to protect the planned schools, it is only required to be constructed before the occupation of the planned schools.

The proposed direct mitigation measures are presented in *Annex C11*.

With the provision of the proposed direct mitigation measure, the predicted overall noise levels at most of the NSRs still exceed the *EIAO-TM* noise criteria due to the noise contributions from the other existing roads. However, the predicted noise levels due to the Project at all NSRs comply with the *EIAO-TM* noise criteria. *Annex C11* presents the breakdown of the noise levels for the scenarios without the Project, with the Project (without mitigation) and with the Project (with mitigation). Detailed results of the road traffic noise impact assessment with the road plots and input files are presented in *Annex C11*.

As the noise contributions from the Project to the increase in the predicted overall noise levels at the NSRs are not more than 1.0 dB(A) and the predicted noise levels due to the Project at all NSRs comply with the *EIAO-TM* noise criteria, no further direct mitigation measures are considered effective in mitigating the noise impact.

4.8 RESIDUAL ENVIRONMENTAL IMPACTS

4.8.1 Construction Phase

With the implementation of the recommended noise control mitigation measures, the cumulative construction noise levels from the Project and the concurrent projects would comply with the *EIAO-TM* daytime noise criteria. No residual impact is anticipated.

4.8.2 Operational Phase

With the provision of the proposed direct noise mitigation measure, the noise contributions due to the Project at all representative NSRs would be less than 1.0 dB(A) and the predicted noise levels due to the Project would all comply with the *EIAO-TM* noise criteria. Noise exceedance at the representative NSRs, if any, would be due to the other existing roads.

As the contributions from the Project to the increase in the predicted overall noise levels are not more than 1.0 dB(A), none of the representative NSRs is considered eligible for indirect technical remedies in the form of acoustic insulation and air conditioning under the *EIAO-TM*.

4.9 ENVIRONMENTAL MONITORING AND AUDIT

4.9.1 Construction Phase

With regard to the potential noise impact arising from the construction activities of the Project on the nearby NSRs, it is recommended that Environmental Monitoring and Audit (EM&A) be undertaken during the construction phase of the Project. The EM&A programme is required to monitor compliance with permissible noise levels. In addition, site audits are recommended to be undertaken regularly during the construction phase to ensure that appropriate environmental protection and pollution control mitigation measures are properly implemented. Details of the EM&A requirements are provided in *Section 10* and the *EM&A Manual*.

4.9.2 Operational Phase

Notwithstanding that noise exceedance was predicted for the planned NSRs only and the existing NSRs will not be subject to adverse noise impacts during the operational phase of the Project, noise monitoring is recommended to be carried out during the first year after opening to ensure noise compliance. Details of the EM&A requirements are provided in *Section 10* and the *EM&A Manual*.

4.10 CONCLUSIONS

4.10.1 Construction Phase

The construction noise impacts of the Project during normal daytime working hours were predicted in this *EIA Study*. With the use of quiet PME, movable barriers and scheduling of construction activities, the noise levels at all representative NSRs are predicted to comply with the construction noise standards.

4.10.2 Operational Phase

The potential road traffic noise impacts were assessed based on the worst case traffic forecast for Year 2026. The predicted noise levels exceeded the *EIAO-TM* noise criteria due to both Project and other existing roads at the planned schools within the G/IC site. A direct mitigation measure was proposed to mitigate the noise impacts at the NSR PS1, where the predicted noise levels due to the Project exceeded the *EIAO-TM* noise criteria.

With the proposed 2.5m high vertical barrier for the planned schools, the contributions from the Project to the increase in the predicted overall noise levels at all representative NSRs was not more than 1.0 dB(A). The predicted

noise levels due to the Project complied with the *EIAO-TM* noise criteria, though the overall noise levels at most of the NSRs would still exceed the *EIAO-TM* noise criteria. However, these noise exceedance are due to the other existing roads.

5 AIR QUALITY ASSESSMENT

5.1 INTRODUCTION

This *Section* assesses the potential air quality impact associated with the construction and operation of the Project.

5.2 RELEVANT LEGISLATION AND GUIDELINES

The principal legislation for the management of air quality in Hong Kong is the *Air Pollution Control Ordinance* (*Cap. 311*) (*APCO*). Under the APCO, *Air Quality Objectives* (AQOs) were established for the management of air quality in Hong Kong. *Table 5.2a* presents the statutory limits for air pollutants and the maximum allowable numbers of exceedances over specific periods.

Table 5.2a Hong Kong Air Quality Objectives (μg m^{-3}) [(a)]

Air Pollutant	Averaging Time			
	1 Hour [(b)]	8 Hours [(c)]	24 Hour [(c)]	1 Year [(d)]
Sulphur Dioxide (SO_2)	800	-	350	80
Total Suspended Particulates (TSP)	-	-	260	80
Respirable Suspended Particulates (RSP) [(e)]	-	-	180	55
Nitrogen Dioxide (NO_2)	300	-	150	80
Carbon Monoxide (CO)	30,000	10,000	-	-
Photochemical Oxidants (as ozone) [(f)]	240	-	-	-

Notes:

(a) Measured at 298K (25°C) and 101.325 kPa (one atmosphere)
(b) Not to be exceeded more than three times per year
(c) Not to be exceeded more than once per year
(d) Arithmetic mean
(e) Respirable suspended particulates means suspended particles in air with a norminal aerodynamic diameter of 10 micrometres or smaller
(f) Photochemical oxidants are determined by measurement of ozone only.

The *EIAO–TM* also stipulates an hourly total suspended particulates (TSP) concentration of 500 μg m^{-3} for construction dust impact assessment.

5.3 BASELINE ENVIRONMENTAL CONDITIONS AND SENSITIVE RECEIVERS

5.3.1 Baseline Environmental Conditions

The existing air quality in the Study Area (*Figure 5.3a*) is predominantly influenced by the vehicular emissions from the existing POR, Castle Peak Road and YLH and their slip roads. The nearest air quality monitoring station (AQMS) operated by Environmental Protection Department (EPD) is located on the roof of Yuen Long Government Offices. The annual average concentrations of NO_2, RSP and TSP recorded for the last five years at the Yuen Long AQMS were used as the background data for assessing the total air quality for this assessment. The data from the Yuen Long AQMS are summarised in *Table 5.3a*.

Table 5.3a Background Air Quality

Air Pollutants	Background Concentration (μg m^{-3}) [a]
Nitrogen Dioxide (NO_2)	60
Respirable Suspended Particulates (RSP)	64 [b]
Total Suspended Particulates (TSP)	103 [b]

Notes:

(a) Annual average data on air pollutant concentrations measured at EPD Yuen Long AQMS for the past 5 years (2003 – 2007) (http://www.epd-asg.gov.hk/english/report/aqr.php)

(b) The RSP and TSP levels recorded at EPD Yuen Long AQMS exceeds the corresponding Air Quality Objective.

5.3.2 Air Sensitive Receivers

Air sensitive receivers (ASRs) were identified according to *Annex 12* of EIAO-TM. Planned developments were identified with reference to the latest Outline Zoning Plan (No. S/YL/17 gazetted in November 2007). The identified ASRs are presented in *Table 5.3b* and *Figure 5.3a*.

The existing environment of the Study Area is predominantly rural with a number of villages within its boundary. YOHO Town Phase I, which is a more recent high-rise development with five residential blocks, is located to the southwest of the POI. Two planned ASRs (ie ASRs A3 and A7), which are comprehensive developments with both residential and commercial uses, have been identified in Yuen Long Areas 15 and 12 to the northwest and southwest of the POI, respectively.

5.4 POTENTIAL SOURCES OF IMPACT

5.4.1 Construction Phase

The Project involves the construction of a flyover and a number of new slip roads, resurfacing and re-marking of existing road sections to provide an additional traffic lane. The major dust generating construction activities associated with the Project are the demolition of existing structures, site formation, minor excavation and filling works, removing lane markings from the existing road surface, piling, concreting and road paving works.

Excavation and backfilling will be required for site formation and foundation works. About 32,000 m^3 of materials (ie, about a total of 74 m^3 per day of excavated materials) [1] will be excavated from different construction works throughout the construction phase and about 23,300 m^3 of which will be surplus materials to be transported off-site (ie about 13 truckloads per day of

[1] Assuming 24 working days a month, the daily generation rate of excavated materials = 32,000 m^3 / 18 months / 24 days = 74 m^3 per day.

excavated materials will be transported off-site per day [1]). HyD has estimated that The excavated materials are generated from the 9th month to the 21st month (tentatively scheduled for the period from August 2010 to August 2011). Since the construction of slip roads will be carried out in small sections, the works area for each section will be small and confined. The quantity of excavated materials generated from each construction worksite will therefore be limited. In view of the nature of the Project and the small area of works sites for each section, it is not anticipated that dust emissions will cause adverse air quality impacts within the Study Area with the implementation of the good site practices and dust control measures recommended in *Section 5.7*.

Potential air quality impacts may arise from the use of Powered Mechanical Equipment (PME) during the construction works. Since the number of PMEs required on-site will be limited, the gaseous emissions associated with the operation of such equipment on site are expected to be minor and will not cause adverse air quality impacts.

5.4.2 Operational Phase

Vehicular emissions are the potential sources of impact during the operation of the Project. Vehicular emission sources within the Study Area are dominated by road traffic on the proposed new road sections and the existing road network including POR, Castle Peak Road and YLH.

The objective of the Project is to relieve the traffic pressure and traffic queue of the existing POR. The design flow of POI, Castle Peak Road and Yuen Long Highway will be maintained, and therefore no increase of traffic will occur as a result of this Project.

Nitrogen dioxide (NO_2) and respirable suspended particulates (RSP) are the key air pollutants of concern.

5.4.3 Cumulative Impacts

As indicated in *Section 2.3*, *Kau Hui Development - Engineering Works in Area 16, Yuen Long Phase 2 - Extension of Road L3 (Project No. 7721CL/A)* and *Proposed Left-Turn Lane at Pok Oi Interchange for the Development at YOHO Town Phase II* are identified as concurrent projects that may cause cumulative environmental impact with this Project in the vicinity.

The scope of *Kau Hui Development - Engineering Works in Area 16, Yuen Long Phase 2 - Extension of Road L3 (Project No. 7721CL/A)* mainly comprises the extension of an existing carriageway by about 220m and its associated drainage and landscape works. The proposed project is under tender assessment stage. The construction is expected to commence in end 2008 and end in 2011.

[1] Assuming one truckload is 6m³ and a bulking factor of 1.4, the number of truck trips for transporting surplus materials offsite per day is 23,300 x 1.4 ÷ 18 ÷ 24 ÷ 6 = 12.5 Bulking factor is defined as the volume after excavation (or bulk volume) divided by the volume before excavation (or undisturbed volume).

A dedicated left-turn lane for access to the planned private development of YOHO Town Phase II from Castle Peak Road – Yuen Long Section immediately west of POR will be constructed by Sun Hung Kai Properties Ltd. together with the said development. The construction period is envisaged to be about one year. The works will be completed in or before 2010.

Construction Phase

The construction programme of the Project will have an overlap of about 10 months and 1 year with the above-mentioned concurrent projects, respectively. No major excavation works are expected to be required for the concurrent projects, hence, adverse cumulative dust impacts are not anticipated.

Operational Phase

The Kau Hui Development and the dedicated left-turn lane for access to the planned private development of YOHO Town Phase II from Castle Peak Road – Yuen Long Section will be considered in the operational phase air quality impact.

5.5 ASSESSMENT METHODOLOGY

5.5.1 Construction Phase

As discussed in *Section 5.4.1*, no adverse dust impact is expected, and therefore no quantitative assessment is required.

5.5.2 Operational Phase

Vehicular Emission Rate Estimation

As discussed in *Section 5.4.2*, NO_2 and RSP are the concerned air pollutants from vehicular emissions. The EMFAC-HK model was adopted to estimate the NO_2 and RSP emission rates for the input to the subsequent dispersion model for the assessment of the air pollutant concentrations in the vicinity of the Project.

The Guideline on Modelling Vehicle Emissions by EPD was used as a reference to develop the assumptions and parameters for the EMFAC-HK for this Project.

The methodology and assumptions were developed with reference to the adopted for the approved *EIA of Widening of Tuen Mun Road at Tsing Tin Interchange* (EIA-142/2007). Some assumptions were made in accordance with published information from the EPD and relevant Government departments.

Vehicle Classes

Based on the information in *Table 4.4 (Registration and Licensing of Vehicle by Fuel Type)* of the *Transport Monthly Digest (Apr 2008)* and the vehicle population provided by EPD, the modelled "vehicle fleet" (ie, all motor vehicles operating on roads within the Study Area) was broken down into 16 vehicle classes as shown in *Table 5.5a*. The vehicle group classification was based on the definition in The *Annual Traffic Census 2006 – Appendix F Vehicle Classification System*.

Table 5.5a Vehicle Classes in EMFAC-HK Model

Vehicle Class	Description	Fuel Type	Gross Vehicle Weight
MC1	Petrol Private Cars (PC) & Light Goods Vehicles (LGV)	Petrol	All
MC3	Diesel Private Cars & Light Goods Vehicles <2.5t	Diesel	<=2.5 t
MC4	Diesel Private Cars & Light Goods Vehicles	Diesel	>2.5–3.5 t
MC5	Public Light Bus	LPG, Diesel	All
MC6	Light Goods Vehicles	Diesel	>3.5-5.5 t
MC7	Medium & Heavy Goods Vehicles with GVW 5.5-15t	Diesel	>5.5-15 t
MC8	Medium & Heavy Goods Vehicles with GVW >=15t	Diesel	>15 t
MC10	Double Deck Franchised Buses	Diesel	All
MC11	Motor Cycles	Petrol	All
Taxi3	Taxi	LPG	All
Taxi4	Private Light Buses < 3.5t	LPG, Diesel	<=3.5 t
Taxi5	Private Light Buses > 3.5t	LPG, Diesel	>3.5 t
Taxi6	Non- franchised Buses <6.4t	Diesel	<=6.4 t
Taxi7	Non- franchised Buses 6.4-15t	Diesel	>6.4-15 t
Taxi8	Non- franchised Buses >15t	Diesel	>15 t
Taxi10	Single Deck Franchised Buses	Diesel	All

According to the *Transport Monthly Digest (Apr 2008)*, 0.5% of private cars operated on diesel fuel and 3% of the light goods vehicles (LGV) in Hong Kong are operated on petrol fuel. The adoption of stringent emission standards for diesel private cars since April 1998 (*Hong Kong Yearbook 2000*) [1] has also virtually halted respective registrations. All private cars were therefore assumed to be run on petroleum and grouped as 'petrol private car', and all light goods vehicles were assumed to be using diesel fuel and grouped as 'diesel light good vehicle' in the model.

Road Grouping

With reference to the current road links and design scheme within 500m of the site boundary, the speed limits on (i) Yuen Long Highway; (ii) newly proposed northbound flyover, (iii) Castle Peak Road and (iv) road links merging with POR and main roads and other local roads are 80 kph, 70 kph, 50 kph and <8kph, respectively. Details of the current road design scheme and road classifications are presented in *Figure 5.5a*.

DATE: 25/08/2008

Environmental Resources Management

ERM

Modelling Modes

The latest version of the model, EMFAC-HK v1.2, provided by EPD was employed in this Project. "Burden mode" was selected as it is the one that can provide the hourly vehicular emissions according to the diurnal variations of vehicle-mile-travelled (VMT), trips, ambient temperature, relative humidity and speed. Model output files in both TextFile (CSV) and MVE17G (CSV) formats were generated.

Exhaust Technology Fractions

Each vehicle class had diverse technological factors in different years. According to the underlying assumption in EMFAC-HK, each vehicle class could be modelled by individual characteristics of unique technology groups. Each technology group representing the same vehicle class had the same emission control technologies, similar in-use deterioration rates and responded the same to repair. In short, emission performances from the same class of vehicles would be identical due to same emission standards and emission control measures installed.

The *Up to Date Vehicle Licensed Number by Age and Technology Group Fractions* listed on the EPD website had been adopted in the model run. While the exhaust technology fractions are only provided up to Year 2003, data after 2003 have been projected in accordance with EPD *Guidelines on Modelling Vehicle Emissions Appendix II 'The Implementation Schedule of Vehicle Emission Standards in Hong Kong'*, Appendix III *'The Technology Group Indexes'*. The breakdown of technology fractions in the transition periods between each EURO type in the *Implementation Schedule of Vehicle Emission Standards in Hong Kong* had been projected based on the implementation time of emission standard during the listed year in the *Implementation Schedule of Vehicle Emission Standards in Hong Kong*.

According to the EPD's *Guideline on Modelling Vehicle Emissions*, all emission control programs implemented in Hong Kong have been included in the EMFAC-HK model. While no other emission control measures were assumed in the assessment, reference was made for the projected breakdown (%) in Years 2004 to 2026 of diesel & LPG private light bus > 3.5t to data before 2003 in "*Technology Group Fraction*" table provided by EPD. For emission standard implementation years, a conservative approach was used in the assumption of technology fractions based on the *Implementation Schedule of Vehicle Emission Standards in Hong Kong* and the *Up to Date Vehicle Licensed Number by Age and Technology Group Fractions.*

In accordance with EPD's *Guideline on Modelling Vehicle Emissions Appendix II*, emission standard of diesel franchised buses would be upgraded to Euro III since 1 October 2001. However, franchised bus – single deck (FBSD) in 2001 was not upgraded to Euro III in the technology group fraction table provided by EPD. As a conservative approach, the emission standards of FBSD in Year 2001 - 2005 were therefore assumed to be Euro II and the emission standards of FBSD after Year 2005 had followed those provided in the *Implementation*

Schedule of Vehicle Emission Standards in Hong Kong. In addition, no detailed breakdown of technology fraction for FBDD and FBSD before 1995 was available. As a conservative approach, the technology fractions for all FBDD and FBDD before 1995 were classified as pre-Euro. The adjusted technology group fractions are presented in *Annex D1-1*. A summary of the applied technology fractions is also presented in *Annex D1-2*.

Evaporative Technology Fractions

Default values in EMFAC-HK were adopted.

Vehicle Population

As recommended in the EPD's *Guideline on Modelling Vehicle Emissions*, the Vehicle Population in Year 2003 were used except for private cars and taxis. After the implementation of stringent emission standards in 1998, new certification of diesel private cars registration ceased. The number of diesel private car was therefore extracted and grouped as petrol private car, while LGV < 2.5t and LGV 2.5t – 3.5t was also extracted and grouped as diesel LGV < 2.5t and LGV 2.5t – 3.5 respectively. Since the implementation of a subsidy program in 2001, 99.9% of the taxis in Hong Kong have switched from diesel to LPG by 2003. With the choice of only one fuel type available for taxis in the EMFAC-HK model, 100% of taxis in the Study Area were assumed to be LPG taxi.

The Environment, Transport and Works Bureau (ETWB) implemented an incentive scheme that encouraged replacement of diesel public light buses with LPG or electric ones since 2002. According to the EPD's information [1], about 58% of the registered public light buses are currently operating on LPG, while 2,500 public light buses have switched from diesel to LPG with reference to information regarding LPG Vehicle Scheme from EMSD [2]. As a conservative approach, the incentive scheme for public light buses was not considered in this assessment. The vehicle population in Year 2011 was calculated and is summarized in *Annex D2*.

Accrual Rate

The accrual rates in the EMFAC-HK model are estimated from the local mileage data adjusted to reflect the total vehicle-mile-travelled (VMT) for each vehicle class. The default rates were used in this Study.

Diurnal Variation of Daily Trips

Hourly Traffic Flow : Peak hour flows at 0800-0900 and 1800-1900 for all vehicle classes in 2026 were projected. Non-peak hour traffic flow (00:00 - 08:00 and 09:00 - 12:00) was calculated by weighing against the percentage of daily flow in 08:00-09:00, while the non-peak hour traffic flow (12:00 - 18:00

(1) EPD website, Cleaning the Air at Street Level, http://www.epd.gov.hk/epd/english/environmentinhk/air/prob_solutions/cleaning_air_atroad.html

(2) EMSD website, LPG Vehicle Scheme, http://www.emsd.gov.hk/emsd/eng/sgi/lpg.shtml

and 19:00 - 00:00) were calculated by weighing against the percentage of daily flow in 18:00-19:00. The hourly traffic flow and the breakdown have been approved by the Transport Department. The hourly traffic flow and breakdown are presented in *Annexes D3*.

Calculation of Diurnal Variation of Daily Trips : The diurnal variation of daily trips was used to estimate the start emissions of petrol vehicles, thus the trips of those vehicles other than petrol vehicles were assumed to be zero. The number of trips per day of petrol vehicle was equivalent to the number of cold starts per day. Cold starts were expected at those road links merging with the POI and at the Pok Oi Hospital exit and no cold starts were expected on the middle of Yuen Long Highway and Castle Peak Road. Diurnal variation of daily trips with cold starts was estimated based on the ratio of trip/VMT in the entire territory and the Study Area. The vehicle trips on respective roads were determined using the following formula:

Vehicle Trip of Class 1 in the Study Area at hour 1 = [VMT for Vehicle Class 1 in the Study Area at hour 1] X [Vehicle Trip of Class 1 in the territory (default in model)] / [VMT for Vehicle Class 1 in the Territory (default in model)]

Diurnal Variation of Daily Vehicle Mile Travelled (VMT)

The VMT represents the total distance travelled by vehicles on a weekday. The VMT was calculated by multiplying the number of vehicles based on the forecast hourly traffic flow in Year 2026 and the length of road travelled in the Study Area. The input in the model was in terms of vehicle/fuel/hour.

The calculation of VMT for Public Light Bus (PLB) had taken in the assumption that LPG PLB and Private Light Bus (PrLB) made up 58% and 13%of the total light bus population, respectively with reference to *Table 4.4* (Registration and Licensing of Vehicles by Fuel Type) of the *Transport Monthly Digest (Apr 2008)*. All PrLBs were also assumed to be operating from 07:00 to 19:00, and therefore the VMTs during the other hours were taken to be zero. The calculated VMTs for all vehicle classes are summarized in *Annex D4*.

Hourly Temperature and Relative Humidity Profile

The Wetland Park meteorological station, operated by the Hong Kong Observatory (HKO), is the closest station to the Project and the hourly data of ambient temperature and relative humidity recorded at this station in 2007 were adopted for the model input.

Speed Fraction

Reference was made to the information provided by the Highways Department for the speed limits of each road and was approved by the Transport Department (*Annex B*). The design speed limits for most road links within the Study Area are 50kph, whereas the limit on the newly proposed northbound flyover and Yuen Long Highway are 70 kph and 80 kph, respectively (refer to *Figure 5.5a*). The vehicles at the road junctions connecting to the POR and Castle Peak Road would slow down, and as a

conservative approach, the road speeds for respective links with cold start were assumed to be less than 8 kph. It is also assumed in the model that all vehicle classes had the same speed profile. During the peak hour, the vehicle speeds would be reduced and the peak hour speed was derived based on the peak traffic flow in Year 2026 and volume/capacity ratio. During the peak hour, the speeds of (i) Yuen Long Highway; (ii) newly proposed northbound flyover; and (iii) Castle Peak Road and other roads were determined to be 71 kph, 63 kph and 31 kph, respectively. The maximum speed for buses, MGVs/HGVs and motorcycles was estimated to be 63 kph during the peak hour as the maximum speed of these vehicle types are restricted to 70 kph. Road links where cold start existed were expected to have a speed limit of less than 8 kph during the peak hour in 2026.

Among all daily emission rates, the road speed fractions that led to the worst case emissions were applied to predict emission factor. The total daily NO_x and RSP emissions from vehicles travelling at the design flow speed and the peak hour flow speed in 2026 were therefore compared in the sensitivity test. The NO_x and RSP emissions predicted from non-peak and peak hours were compared and the road speed that generating higher NO_x and RSP emissions were applied to all hours in the prediction of total hourly emissions in this Study as a conservative approach.

Sensitivity Test for Identification of Worst Speed Limit for EMFAC-HK Model

A sensitivity test was conducted using the traffic flow in 2026 to simulate the effect on the total daily NO_x and RSP emissions during the peak (ie, peak-hour flow speed) and non-peak hours (ie design speed). The results of the sensitivity test for different road groups are summarized in *Tables 5.5b* to *5.5e*.

The sensitivity test results indicate that the total daily NO_x emissions are higher during the peak hour at lower speeds (<50kph) and during the non-peak hour at higher speeds (70-80kph). On the other hand, the total RSP emissions at all speeds are higher during the peak hour. The sum of emissions for NO_x and RSP of all road groups during the peak hour is higher than that of the non-peak hour. As a result, the peak-hour flow speed was adopted for the estimation of the worst-case NO_x emissions on low speed road links (50kph (with cold starts) and 50kph) and RSP emissions at all road links (50kph (with cold starts), 50kph, 70kph and 80kph) in the EMFAC-HK model. The non-peak hour flow speed was adopted for the estimation of the worst case NO_x emissions on high speed roads (70kph and 80kph).

Model Year

EMFAC-HK model was run for the year from 2011 to 2026 using the VMT of each road link and the peak-hour flow speed in Year 2026. A summary of the predicted total daily NO_x and RSP emissions are summarized in *Annex D5* and the highest total daily NO_x and RSP emissions would occur in year 2011. Therefore, the hourly emissions of each vehicle type in 2011 were divided by the corresponding total VMT to determine the emission factors in gram per miles per vehicle and maximum emission factors which are summarized in *Annex D6*. The maximum emission factor for each vehicle type was adopted in the subsequent CALINE4 air dispersion model for the prediction of pollutant concentrations at the Air Sensitive Receivers (ASRs).

Sensitivity Test for AM and PM Peak Hourly Traffic Flow and Vehicle Mix

A sensitivity test between the AM and PM peak traffic flows and vehicle mixes was conducted to simulate the total vehicular emissions. A summary of the predicted NO_x and RSP emission factors by adopting the AM and PM traffic data was presented in *Annex D7*. The sensitivity test results indicate the AM peak hourly traffic flow and vehicle mix produce higher NO_x and RSP emissions and hence the AM peak hourly traffic flows and vehicle mixes in 2026 (ie 15 years after the Project completion) are used for the worst case estimation.

Assessment of Air Pollutant Concentrations

The EPD-approved air dispersion model, CALINE4, was used to predict the maximum hourly and daily concentrations of NO_2 and RSP at 1.5m to 20m above ground of the identified ASRs. The CALINE4 model calculates hourly concentrations only. With reference to *Screening Procedures for Estimating the Air Quality Impact of Stationary Source* (EPA-454/R-92-019), a conversion factor of 0.4 was used to convert the maximum hourly concentrations to daily average concentrations.

The forecasted AM peak hourly traffic flow, vehicle mixes for relevant road links and fleet emission factors of NO_2 and RSP in 2026 for the CALINE4 model prediction are presented in *Annex D8*. In accordance with EPD's *Guidelines on Choice of Models and Model Parameters*, 20% of NO_x was assumed to be converted into NO_2 for the purpose of this assessment.

The following daytime worst-case meteorological conditions were adopted in the model run:

- Wind speed 1 ms^{-1}
- Wind direction worst case for each ASR
- Stability class D
- Standard deviation of wind direction 12
- Surface roughness 100 cm
- Mixing height 500 m
- Ambient temperature 25.5 °C

Background NO_2 and RSP concentrations, as presented in *Table 5.3a*, were added to the predicted concentrations to obtain cumulative air pollutant concentrations to check against the respective AQO criteria.

Existing and future noise barriers, if installed for the road links considered, have also be taken into account in the model by shifting the road height to the top of the noise barrier.

Isopleths showing hourly and daily NO_2 and RSP concentrations within the Study Area were also plotted to show the general impacts of the air pollutants in the vicinity of the Project.

5.6 EVALUATION OF IMPACTS

5.6.1 Construction Phase

As discussed in *Section 5.4.1*, in view of the nature, relatively small scale of the Project and small construction works area, it is not anticipated that dust emissions will cause adverse air quality impacts within the Study Area with the implementation of good site practices and the dust control measures recommended in *Section 5.7*.

5.6.2 Operational Phase

Cumulative maximum hourly concentrations of NO_2 and daily average concentrations of NO_2 and RSP, taking the background concentrations of the respective pollutants into account, were predicted at 1.5 to 20m above ground level. The results are shown in *Tables 5.6a* to *5.6c*.

A13 [b]	74	74	74	-	-
A14 [b]	73	73	73	-	-
A15 [b]	80	80	80	-	-
AQO	**180**	**180**	**180**	**180**	**180**

Notes:

(a) Background concentrations of RSP (i.e. 64 μgm^{-3}) have been included.

(b) As the maximum heights of ASRs A1, A2, A5, A10 to A15 are all below 10 m above ground, therefore, the impact was assessed at 1.5m, 5m and 10m above ground only.

(c) As ASR A6 is a one-storey building, the impact was only assessed at 1.5m and 5m above ground.

The predictions show that there are no exceedance of the AQOs for maximum hourly and 24-hour average concentrations of NO_2 and 24-hour average concentrations of RSP at all identified ASRs taking into account the background concentrations and the existing and future noise barriers. The predicted maximum hourly and 24-hour average NO_2 concentrations and 24-hour average RSP concentrations range from 101 - 282 $\mu g\ m^{-3}$, 77 - 149 $\mu g\ m^{-3}$ and 72 – 104 $\mu g\ m^{-3}$, respectively and the worst affected height is predicted at 1.5m above ground at all identified ASRs.

Figures 5.6a to *5.6f* show the maximum hourly and 24-hour average NO_2 and 24-hour average RSP concentrations at 1.5m and 10m above ground level. The different time averaged NO_2 and RSP concentrations are well within the respective AQOs at all ASRs taking into account the background concentrations. Exceedance of maximum hourly and daily NO_2 concentration was predicted along YLH. The affected areas are YLH and the embankment of YLH and no ASRs are located within the affected area. Hence, the air quality impact due to the Project and the current road links are acceptable.

It must be emphasized that the objective of the Project is only to relieve the traffic pressure and traffic queues of the existing POR and that the design traffic flow / capacity ratio will be maintained. There will not be any

increase in traffic as a result of this Project. The levels of NO_2 and RSP predicted for YLH are mainly due to the existing high traffic volume on that particular road section.

5.7 MITIGATION MEASURES

5.7.1 Construction Phase

The construction of the Project will involve site formation, piling, concreting and road paving works. The dust impact during the construction phase will be minimized with the implementation of good site practices and dust control measures stipulated in the *Air Pollution Control (Construction Dust) Regulation*, which are summarised as follows:

- Any stockpile of dusty material will be covered entirely with impervious sheeting or sprayed with water so as to maintain the entire surface wet;
- Where a site boundary adjoins a road, or other area accessible to the public, hoarding shall be provided a long the entire length of that portion of the site boundary;
- All dusty materials will be sprayed with water immediately prior to any loading, unloading or transfer operation so as to maintain the dusty materials wet;
- Where a vehicle leaving the works site is carrying a load of dusty materials, the load will be covered entirely with clean impervious sheeting to ensure that the dusty materials do not leak from the vehicles;
- The working area of any demolition, excavation or earth moving operation will be sprayed with water or dust suppression chemicals immediately after the operation so as to maintain the entire surface wet;
- The construction plants will be regularly maintained to avoid the emissions of black smoke; and
- The construction plants will be switched off when not in use to avoid gaseous emissions.

5.7.2 Operational Phase

No mitigation measures are required as no exceedances of the respective criteria are predicted.

5.8 ENVIRONMENTAL MONITORING AND AUDIT (EM&A)

Regular site audit during the construction phase is recommended to ensure that mitigation measures recommended in *Section 5.7* are carried out.

No EM&A for air quality is required during operational phase.

5.9 CONCLUSION

The key dust generating construction activities associated with the Project are site formation, minor excavation and filling works, demolition of the existing structures, removal of lane markings on existing road surface, piling, concreting and road paving works. In view of the nature and sequencing of the Project, and the small scale of the construction works, air quality impact due to dust emissions is not anticipated with the implementation of good site practices and dust control measures stipulated in the *Air Pollution Control (Construction Dust) Regulations*. Air quality impact due to gaseous emissions from the use of PMEs during construction works is expected to be insignificant due to the limited use of such equipment and the adoption of good site practices. Regular site audits are recommended to ensure the implementation of the prescribed dust control measures and the adoption of good site practices.

Upon completion of the Project, vehicular emission from the traffic on the open roads is the main potential source of air quality impacts. The key air pollutants from vehicular emissions include NO_2 and RSP. A quantitative assessment has been conducted with the peak hourly traffic flow of the proposed new roads and the existing road network and their fleet emission factors estimated using the EMFAC-HK model. The prediction indicated no exceedance of hourly and daily average concentrations of NO_2 or daily average concentrations of RSP in the vicinity of the Project.

It must be emphasized that the objective of the Project is to relieve the traffic pressure and traffic queues of the existing POR and the design traffic flow / capacity ratio will be maintained. There is not expected to be any increase in traffic as a direct result of this Project.

The vehicular emissions associated with road traffic with the implementation of the Project are expected to comply with the respective AQOs, and therefore will not cause any unacceptable adverse air quality impacts.

6 WATER QUALITY

6.1 INTRODUCTION

This *Section* presents an assessment of the potential water quality impacts associated with the construction and operation of the Project. The key environmental issues in respect of water quality impacts associated with the Project would be the proper control of construction site runoff and drainage during site formation and foundation works for the proposed flyover, slip roads and associated works. Recommendations for mitigation measures have been made, where considered necessary, to minimise the identified water quality impacts to an acceptable level. In accordance with the *EIA Study Brief*, the Study Area should include areas within 300 m of the Site Boundary.

6.2 RELEVANT LEGISLATION AND GUIDELINES

6.2.1 *Water Pollution Control Ordinance (WPCO)*

The *Water Pollution Control Ordinance* (*Cap. 358*) (*WPCO*), in existence since 1980, is the major piece of legislation relating to the protection and control of water quality in Hong Kong. According to the WPCO and its subsidiary legislation, Hong Kong waters are divided into ten water control zones (WCZ). Corresponding statements of Water Quality Objectives (WQO) are stipulated for different water regimes (marine waters, inland waters, bathing beaches subzones, secondary contact recreation subzones and fish culture subzones) in the WCZ based on their beneficial uses. The Study Area is located within the Deep Bay WCZ.

River water quality is ranked according to its compliance with the WQOs. The annual compliance of the monthly water quality data with each of the water quality parameters is indicated by a percentage, with 100% compliance indicating that all data for twelve consecutive months are compliant with the WQO. For the Project, the source of pollutants would predominantly be from any construction runoff that may contain eroded soils. Parameters of concern would therefore be pH, Suspended Solids (SS), Dissolved Oxygen (DO), Chemical Oxygen Demand (COD) and Biological Oxygen Demand (BOD). The WQOs of these parameters for the inland waters of the Deep Bay WCZ are listed in *Table 6.2a*.

Table 6.2a Water Quality Objectives for Inland Waters in Deep Bay WCZ

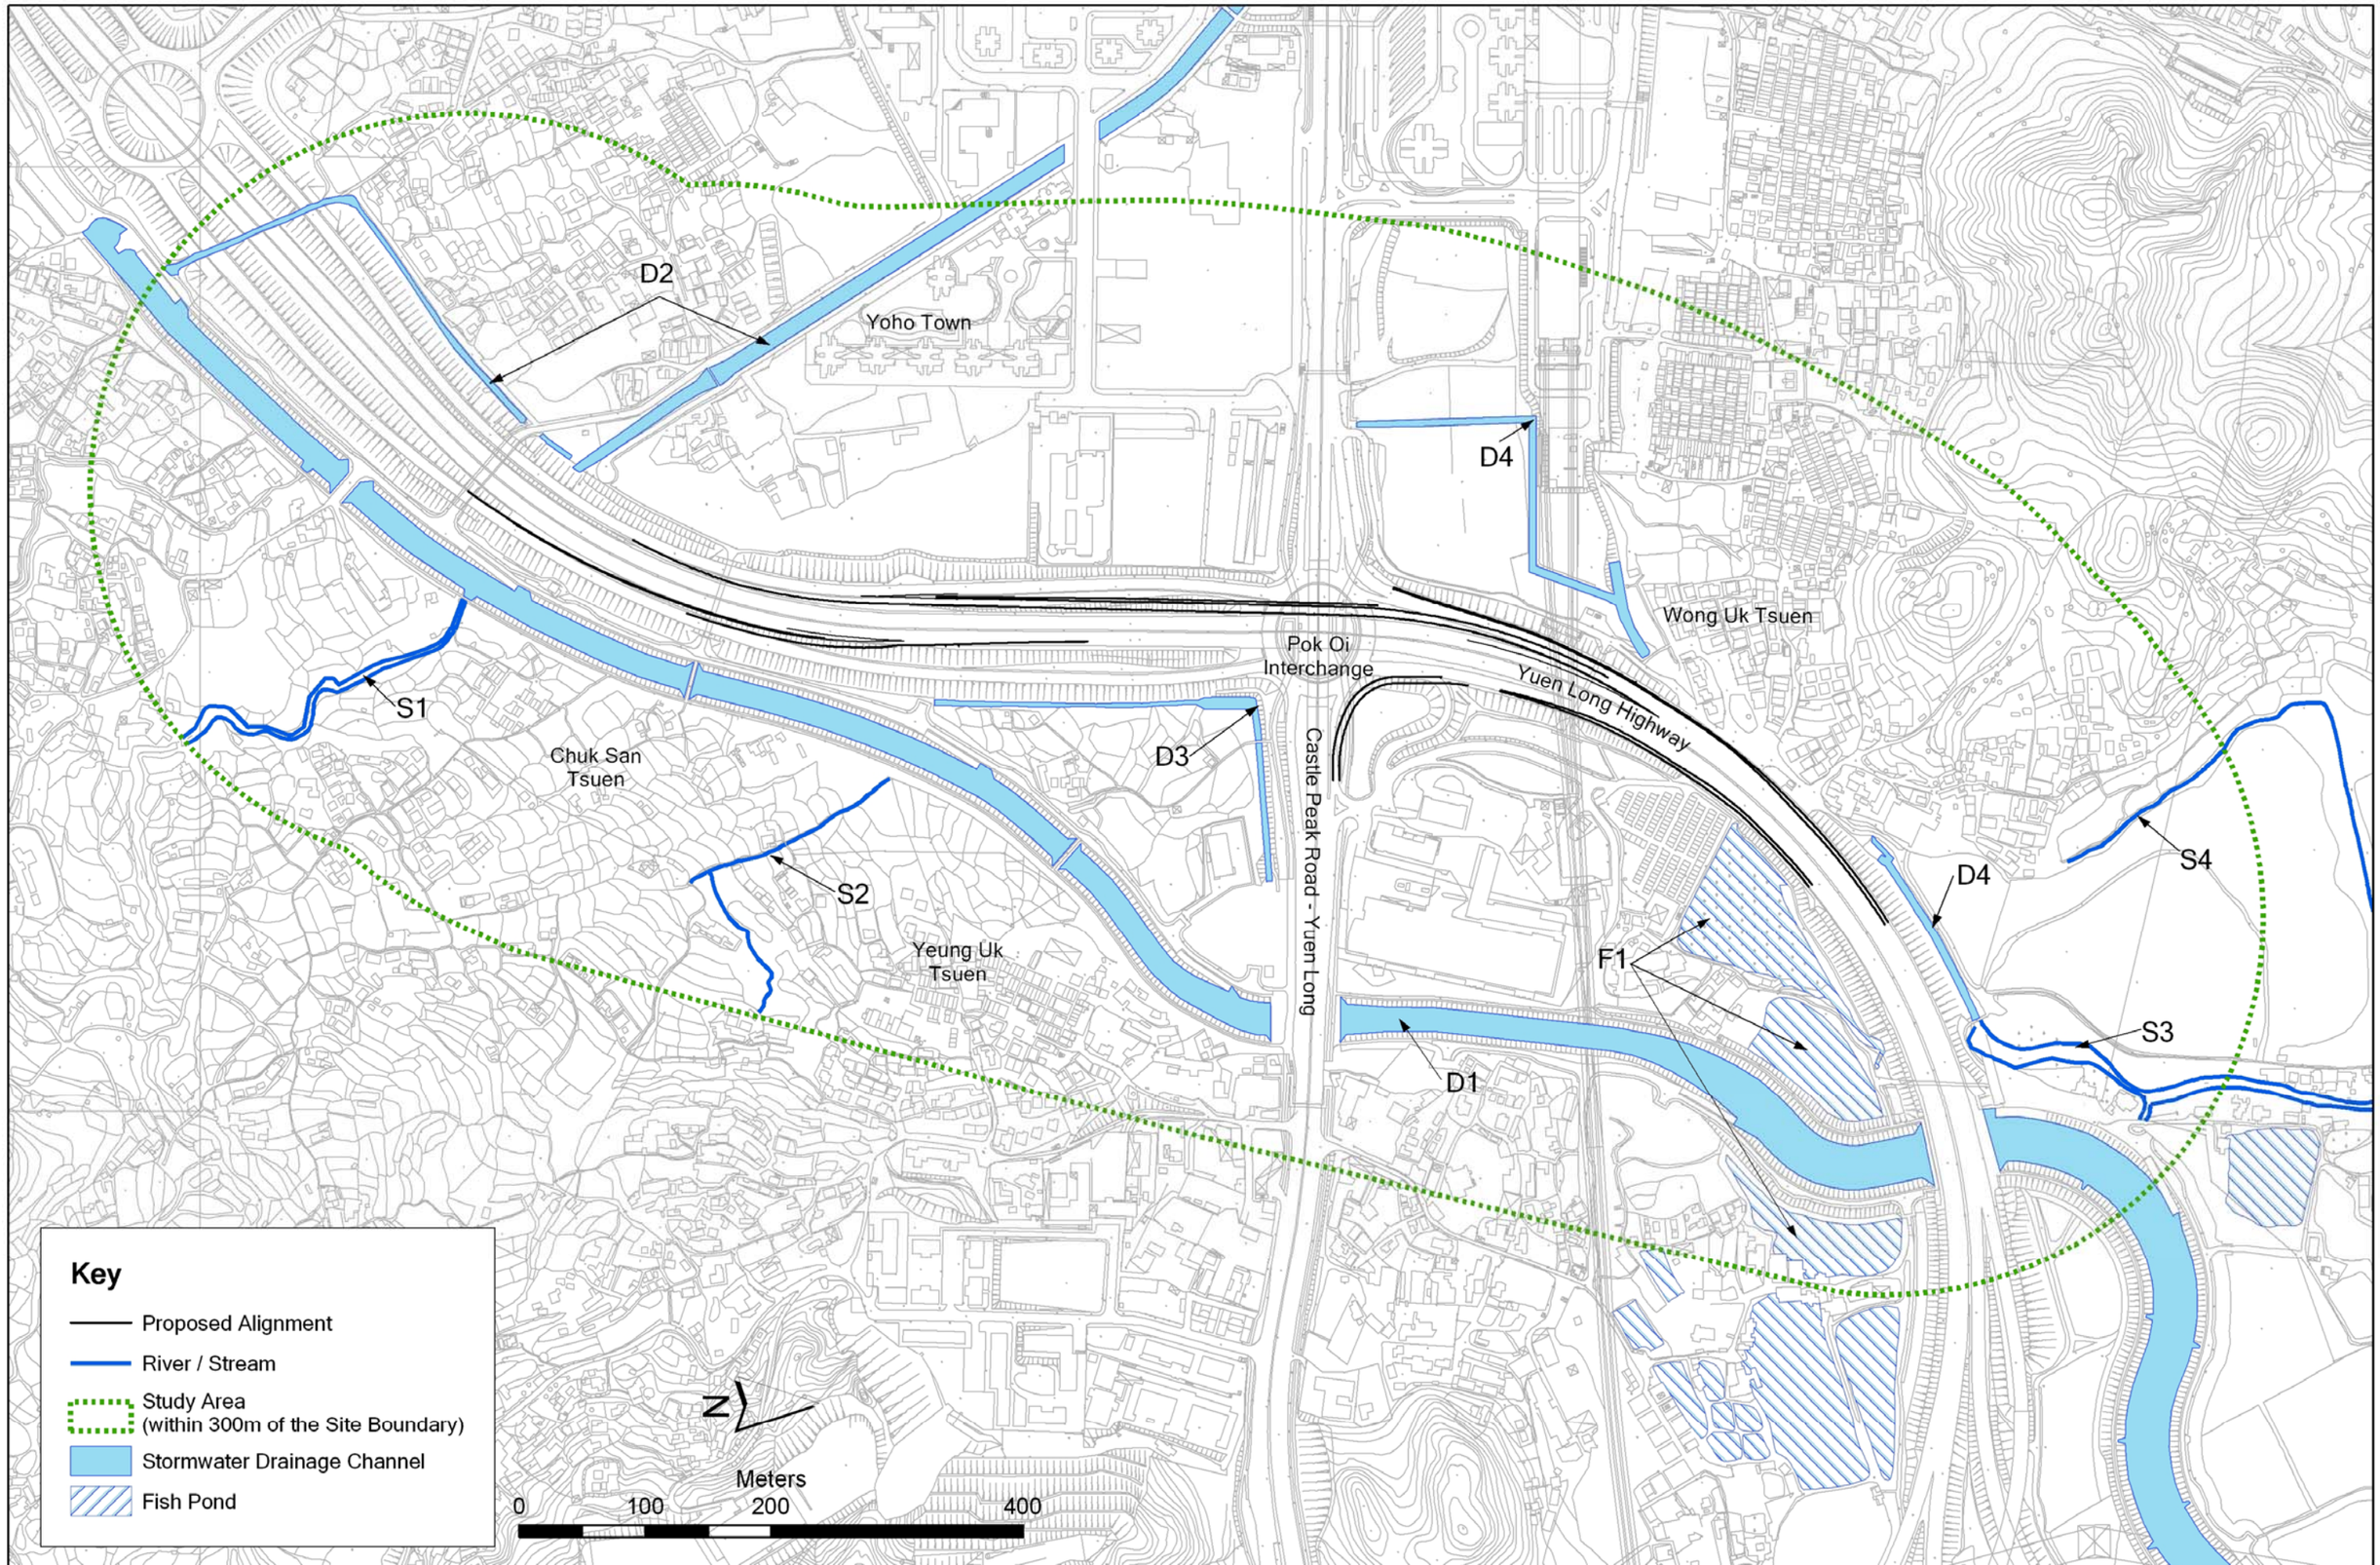
Concerned Parameters	Water Quality Objectives (WQOs)	Deep Bay WCZs or sub-zones to which the WQOs apply
pH	Waste discharges shall not cause the pH of the water to exceed the range of 6.5-8.5 units.	Yuen Long & Kam Tin (Upper and Lower); Beas, Indus & Ganges Sub-zones and Water Gathering Ground Subzones
	The pH of the water should be within the range of 6.0-9.0 units.	Other inland waters
Suspended solids (SS)	Waste discharges shall not cause the annual median of suspended solids to exceed 20 milligrams per litre.	Yuen Long & Kam Tin (Upper and Lower); Beas, Indus & Ganges Sub-zones, Water Gathering Ground Subzones and other inland waters
Dissolved oxygen (DO)	Waste discharge shall not cause the level of DO to be less than 4 mg/L	Yuen Long & Kam Tin (Upper and Lower); Beas, Indus & Ganges Sub-zones, Water Gathering Ground Subzones and other inland waters
Chemical oxygen demand (COD)	Waste discharges shall not cause the chemical oxygen demand to exceed 15 milligrams per litre.	Yuen Long & Kam Tin (Upper) Subzone, Beas Subzone, Indus Subzone, Ganges Subzone and Water Gathering Ground Subzones
	Waste discharges shall not cause the chemical oxygen demand to exceed 30 milligrams per litre.	Yuen Long & Kam Tin (Lower) Subzone and other inland waters
5-day biochemical oxygen demand (BOD)	Waste discharges shall not cause the 5-day biochemical oxygen demand to exceed 3 milligrams per litre.	Yuen Long & Kam Tin (Upper) Subzone, Beas Subzone, Indus Subzone, Ganges Subzone and Water Gathering Ground Subzones
	Waste discharges shall not cause the 5-day biochemical oxygen demand to exceed 5 milligrams per litre.	Yuen Long & Kam Tin (Lower) Subzone and other inland waters

6.2.2 *Technical Memorandum (TM) issued under WPCO*

Besides setting the WQOs, the *WPCO* controls effluent discharging into the WCZs through a licensing system. A *Technical Memorandum on Standards for Effluents Discharged into Drainage and Sewerage Systems, Inland and Coastal Waters* was issued under the *WPCO (WPCO-TM)* which gives guidance on the permissible effluent discharges based on the type of receiving waters (foul sewers, storm water drains, inland and coastal waters). The limits control the physical, chemical and microbial quality of effluents. Under the *WPCO-TM*, effluents discharged into inland waters are subject to standards for particular volumes of discharge. The discharge standard will vary with the use of downstream water. The majority of the inland water bodies within the Study Area (see *Figure 6.2a*) are surface water drains, which are classified as Group D inland waters. Any new effluent discharge during the construction phase would be required to comply with the terms and conditions of a discharge licence, issued by EPD, under the *WPCO*.

6.2.3 *Practice Notes*

A practice note for professional persons (*ProPECC PN*) was issued by the EPD to provide environmental guidelines for handling and disposal of construction



Highways Department The Government of the Hong Kong Special Administrative Region	Consultant Environmental Resources Managment ERM Halcrow Halcrow China Ltd. As Engineering Sub-consultant	Agreement No. : WD 6/2007	Environmental Impact Assessment Report	FIGURE 6.2a	
		Project Title: Improvement to Pok Oi Interchange - Environmental Impact Assessment Study	Figure Title: Water Sensitive Receivers	Checked: PS Designed: TF	Scale: - Drawn: AM Rev. Date: 1/11/2007

0072252_river_base2_revised.mxd

site discharges. *ProPECC PN 1/94*, entitled "*Construction Site Drainage*" provides good practice guidelines for dealing with various types of discharge from a construction site. Practices outlined in *ProPECC PN 1/94* should be followed as far as possible during construction to minimise the water quality impact due to construction site runoff.

6.3 BASELINE CONDITIONS AND SENSITIVE RECEIVERS

6.3.1 Baseline Conditions

The Site is located inland and direct impacts arising from the Project activities on marine water quality are not expected. Supports for the flyover and slip roads would not be located within any watercourses.

The following water bodies are identified within the Study Area. The locations of these water bodies are shown in *Figure 6.2a*:

- There is a main stormwater drainage channel, D1, located to the east of the Site. The drainage channel runs in a generally northerly direction and eventually joins Kam Tin River. The drainage channel was part of Drainage Services Department (DSD)'s drainage improvement works to prevent flooding in Yuen Long District.

- Another stormwater drainage channel, D2, with a width smaller than that of D1 and runs along Yau Tin East/West Road to the southwest of the Site.

- Two small stormwater drains, D3 and D4, are located to the east and west of the Site respectively. Both of the small drains are open channels. D3 is situated between an area of agricultural land to the southeast of POR and the southern arm of POR and it mainly collects the water from the agricultural land. D4 runs across the eastern boundary of Wong Uk Tsuen.

- A group of three fish ponds, F1, are located to the north of the Site and Small Traders New Village in an area between West Rail and YLH.

- A number of small rivers/streams, S1 to S4, run into the drainage channel from the adjacent catchments but all of these are outside the boundary of the Project.

No water quality data are available for these water bodies.

6.3.2 *Water Sensitive Receivers*

The identified water bodies within the Study Area are regarded as Water Sensitive Receivers (WSRs). None of the WSRs are located within the boundary of the Project. The shortest distance from the boundary of the Project to each of the WSRs is shown in *Table 6.3a*.

Table 6.3a Shortest Distance Between the Water Sensitive Receivers (WSRs) and the Limit of the Works Area

WSR	Description	Shortest distance from the Boundary of the Project (m)
D1	Stormwater Drainage Channel	36.4
D2	Stormwater Drainage Channel	133.0
D3	Stormwater Drainage Channel	40.8
D4	Stormwater Drainage Channel	28.0
F1	Fish Pond	13.2
S1	Stream	114.7
S2	Stream	109.0
S3	Stream	156.7
S4	Stream	101.3

6.4 *ASSESSMENT METHODOLOGY*

The Study Area for the water quality impact assessment is defined by a distance of 300 m from the boundary of the Project. The WSRs within the Study Area were identified in *Section 6.3*.

Construction methods and configurations and operation of the Project, as presented in *Sections 2* and *3*, have been reviewed in terms of their potential to impact water quality. Based on this review, potential sources of water quality impact that may arise during the construction and operational phases of the Project have been identified and are presented *Section 6.5*. All the identified sources of potential water quality impact were then evaluated and their impact significance were determined in *Section 6.5*. If considered necessary, effective and practicable water pollution and mitigation measures have been recommended in *Section 6.6* to assist in reducing any identified adverse impacts on water quality to acceptable levels.

6.5 *IDENTIFICATION AND EVALUATION OF ENVIRONMENTAL IMPACTS*

6.5.1 *Construction Phase*

Potential sources of water quality impact associated with the construction of the Project have been identified and include:

- construction site runoff and drainage;
- general construction activities;

- sewage generated by on-site workforce; and
- piling activities.

Construction Site Runoff and Drainage

Runoff from the construction works areas during site clearance and site formation activities may contain increased loads of sediments, other suspended solids and potentially contaminants. Potential sources of pollution from site drainage include:

- runoff and erosion from exposed soil surfaces, earth working areas and stockpiles;
- release of grouting and cement materials with rain wash;
- wash water from dust suppression sprays; and
- fuel and lubricants from maintenance of construction vehicles and mechanical equipment.

Sediment laden runoff may carry pollutants (adsorbed onto the particle surfaces) into the nearby WSRs. Associated effects which may arise include increased suspended solids concentrations in receiving waters and blockage of stormwater drains.

Mitigation measures should be implemented to control construction site runoff and drainage from the works areas, and to prevent runoff and drainage water with high levels of suspended solids from entering the nearby WSRs. With the implementation of adequate construction site drainage and provision of sediment removal facilities as described in *Section 6.6.1*, it is anticipated that unacceptable water quality impacts on the WSRs would not arise.

General Construction Activities

On-site construction activities may cause water pollution from the following:

- uncontrolled discharge of debris and rubbish such as packaging, construction materials and refuse; and
- spillages of liquids stored on-site, such as oil, diesel and solvents, which may be likely to result in water quality impacts if they enter the nearby stormwater drainage channels.

As detailed in *Section 6.6.1*, good construction and site management practices should be observed to ensure that litter, fuels and solvents do not enter the surrounding stormwater drains.

Sewage generated by On-site Workforce

Domestic sewage would be generated from the workforce during the construction phase. It is expected that the temporary sewage will be adequately treated by interim sewage collection facilities, such as portable chemical toilets, which would be installed within the construction site. It is unlikely that sewage generated from the Site would have significant water quality impact on the WSRs, provided that sewage is not discharged directly to the adjacent watercourses, and the interim sewage collection facilities are sufficient and properly maintained.

Piling Activities

Continuous flight auger piling instead of bored piling will be used for the construction of the bridge pier foundations. Any groundwater generated from the piling activities will be collected and directed to sedimentation facilities for treatment before discharge to meet the relevant *WPCO-TM* standards.

Cumulative Impacts

Adjacent projects identified to involve concurrent construction activities during the construction period of the Project are:

- Kau Hui Development – Engineering Works in Area 16, Yuen Long, Phase 2 – Extension of Road L3, to be undertaken by Civil Engineering and Development Department (CEDD); and

- Proposed Left-Turn Lane at Pok Oi Interchange for the Development at YOHO Town Phase II, to be undertaken by Sun Hung Kai Properties Ltd.

The construction works of CEDD's project is scheduled to commence in August 2008 and be completed towards the end of 2010. Excavation works are expected to be completed before the commencement of construction activities for the Project, ie February 2009. The potential for cumulative water quality impacts arising from the concurrent construction activities is considered limited. Should any activities overlap, it is expected that the associated cumulative impacts would be minor with no unacceptable adverse impacts anticipated to occur.

The construction period of Sun Hung Kai's project will last for approximately one year and will be completed on or before 2010. As this project is of a relatively small scale and a short duration, no adverse cumulative water quality impacts are expected to result from its concurrent implementation with the Project.

With the implementation of mitigation measures to control construction site runoff and drainage, potential impacts on water quality would be controlled to within the boundary of the Project.

6.5.2 *Operational Phase*

The only identified potential source of impact on water quality during the operational phase would be runoff from the road surfaces. A surface water drainage system would be provided to collect the road runoff. It is recommended that standard HyD road gullies be installed along the drainage system to trap silt and grit in the first flush of runoff.

6.6 *MITIGATION MEASURES*

Proposed mitigation measures for containing and minimising water quality impacts are summarised below.

6.6.1 *Construction Phase*

Construction Site Run-off and Drainage

Good site practices outlined in ProPECC PN 1/94 should be followed as far as practicable to minimise surface runoff and the chance of erosion, and also to retain and reduce any suspended solids prior to discharge. These practices include the follows:

- Silt removal facilities such as silt traps or sedimentation facilities should be provided to remove silt particles from runoff to meet the requirements of the *WPCO-TM* standard. The design of silt removal facilities should be based on the guidelines provided in ProPECC PN 1/94. All drainage facilities and erosion and sediment control structures should be inspected monthly and maintained to ensure proper and efficient operation at all times and particularly during rainstorms.

- Careful programming of the works to minimise surface excavations for the Project during the wet season. If excavation of soil cannot be avoided during the wet season, exposed slope surfaces should be covered by tarpaulin or other means. Other measures that need to be implemented before, during, and after rainstorms are summarised in ProPECC PN 1/94.

- Exposed soil surfaces should be protected by paving or fill material as soon as possible to reduce the potential of soil erosion.

- Open stockpiles of construction materials or construction wastes on-site of more than $50m^3$ should be covered with tarpaulin or similar fabric during rainstorms. These materials should not be placed near water courses.

- A Drainage Management Plan (DMP) should be prepared by the Contractor and submitted to EPD before the commencement of any construction works to detail the procedures for control of construction site runoff. No site run-off or drainage should be allowed enter the nearby WSRs.

General Construction Activities

- Debris and refuse generated on-site should be collected, handled and disposed of properly to avoid entering the nearby WSRs. Stockpiles of cement and other construction materials should be kept covered when not being used.

- Oils and fuels should only be used and stored in designated areas which have pollution prevention facilities. All fuel tanks and storage areas should be provided with locks and be sited on sealed areas, within bunds of a capacity equal to 110% of the storage capacity of the largest container or 20% by volume of the chemical waste stored in that area, whichever is the greater. The bund should be drained of rainwater after a rain event.

Sewage generated from On-site Workforce

- Temporary sanitary facilities, such as portable chemical toilets, should be employed on-site. A licensed contractor would be responsible for appropriate disposal and regular maintenance of these facilities.

Piling Activities

- Silt removal facilities such as silt traps or sedimentation facilities should be provided to remove silt particles from groundwater to meet the requirements of the *WPCO-TM* standard. The design of silt removal facilities should be based on the guidelines provided in ProPECC PN 1/94. All drainage facilities and erosion and sediment control structures should be inspected and maintained on a regular basis to ensure proper and efficient operation at all times and particularly during rainstorms.

6.6.2 Operational Phase

It is recommended that the standard HyD road gullies be installed along the road drainage system to trap any silt and grit in the first flush of runoff.

6.7 RESIDUAL ENVIRONMENTAL IMPACT

With the full implementation of the recommended mitigation measures for the construction and operational phases of the Project, no unacceptable residual impacts on water quality are expected. It is recommended that regular site audits of the implementation of the recommended mitigation measures be undertaken during the construction phase.

6.8 ENVIRONMENTAL MONITORING AND AUDIT

The impact assessment has evaluated that there would be no water quality impacts on the WSRs within the Study Area. As a result, it is considered that environmental monitoring of water quality is not required. Nevertheless, regular site inspection is recommended to ensure that the recommended mitigation measures are properly implemented.

6.9 CONCLUSIONS

6.9.1 Construction Phase

No WSRs were identified within the limits of the works area. Water quality impacts are negligible and minimal during the construction phase of the Project provided that good site practices and housekeeping are implemented. No water quality monitoring is thus considered necessary during the construction phase.

6.9.2 Operational Phase

For the operation of the Project, the only source of water quality impact would be runoff from the road surface. A surface water drainage system should be provided to collect the road runoff and to facilitate drainage of runoff during rainstorms. With the provision of an appropriate road drainage system, no adverse water quality impacts are anticipated. No operational water quality monitoring is considered necessary.

7 WASTE MANAGEMENT

7.1 INTRODUCTION

This *Section* identifies the potential wastes arising from the construction of the Project and potential environmental impacts associated with the handling and disposal of waste. The assessment is conducted in accordance with the criteria in *Annexes 7* and *15* of the *EIAO-TM* and the requirements of the *EIA Study Brief* for the Project, which are summarised as follows:

- Analysis of Activities and Waste Generation – identify the quantity, quality and timing of the waste arising as a result of the construction and operation activities of the Project;
- Proposal for Waste Management – evaluate the opportunities for reducing waste generation, on-site / off-site reuse and recycling; estimate the types and quantities of waste required to be disposed and the disposal options; the impact caused by handling, collection and disposal of waste;
- Land Contamination Potential – identify all land lots/sites within the study area boundary which are potential contaminated and provides list of potential contaminants and possible remediation options.

7.2 RELEVANT LEGISLATION AND GUIDELINES

The following legislation covers, or has some bearing upon, the handling, treatment and disposal of wastes in Hong Kong, and has been considered in the assessment.

- *Waste Disposal Ordinance (Cap 354);*
- *Waste Disposal (Chemical Waste) (General) Regulation (Cap 354C);*
- *Land (Miscellaneous Provisions) Ordinance (Cap 28)*; and
- *Public Health and Municipal Services Ordinance (Cap 132) - Public Cleansing and Prevention of Nuisances Regulation.*

7.2.1 *Waste Disposal Ordinance (Cap 354)*

The *Waste Disposal Ordinance* (WDO) prohibits the unauthorised disposal of wastes, with waste defined as any substance or article, which is abandoned. Under the *WDO*, wastes can only be disposed of at a licensed site. A breach of these regulations can lead to the imposition of a fine and/or a prison sentence. The *WDO* also provides for the issuing of licences for the collection and transport of wastes. Licences are not, however, currently issued for the collection and transport of construction waste or trade waste.

The *Waste Disposal (Charges for Disposal of Construction Waste) Regulation* defined construction waste as any substance, matters or things that is generated from construction work and abandoned, whether or not it has been processed or stockpiled before being abandoned, but does not include any sludge, screening or matter removed in or generated from any desludging, desilting or dredging works.

The Construction Waste Disposal Charging Scheme came into operation on 1 December 2005. Processing of account applications by the EPD started on the same day. A contractor who undertakes construction work with value of HK$1 million or above is required to open a billing account solely for the contract. Charging for the disposal of construction waste started on 20 January 2006.

Depending on the percentage of inert materials, construction & demolition materials (C&D materials) can be disposed of at public fill, sorting facilities, landfills and outlying islands transfer facilities, where differing disposal costs would be applied. The scheme encourages waste reduction so that the contractor or Project Proponent can minimise their costs. *Table 7.2a* summarises the Government's C&D materials disposal facilities, the types of waste accepted and disposal the associated costs.

Table 7.2a Government Waste Disposal Facilities for C&D Materials

Government Waste Disposal Facilities	Type of Construction Waste Accepted	Charge Per Tonne
Public fill reception facilities	Consisting entirely of inert construction waste	$27
Sorting facilities	Containing more than 50% by weight of inert construction waste	$100
Landfills	Containing not more than 50% by weight of inert construction waste	$125
Outlying Islands Transfer Facilities	Containing any percentage of inert construction waste	$125

7.2.2 Waste Disposal (Chemical Waste) (General) Regulation

Chemical waste as defined under the *Waste Disposal (Chemical Waste) (General) Regulation* includes any substance being scrap material, or unwanted substances specified under *Schedule 1* of the *Regulation*, if such a substance or chemical occurs in such a form, quantity or concentration so as to cause pollution or constitute a danger to health or risk of pollution to the environment.

Chemical waste producers shall register with the Environmental Protection Department (EPD). Any person who contravenes this requirement commits an offence and is liable to a fine and imprisonment. Producers of chemical wastes must treat their wastes, utilising on-site plant licensed by the EPD or have a licensed collector take the wastes to a licensed facility. For each consignment of wastes, the waste producer, collector and disposer of the

wastes must sign all relevant parts of a computerised trip ticket. The system is designed to allow the transfer of wastes to be traced from cradle-to-grave.

The *Regulation* prescribes the storage facilities to be provided on site including labelling and warning signs. To minimise the risks of pollution and danger to human health or life, the waste producer is required to prepare and make available written procedures to be observed in the case of emergencies due to spillage, leakage or accidents arising from the storage of chemical wastes. He/she must also provide employees with training in such procedures.

7.2.3 Land (Miscellaneous Provisions) Ordinance (Cap 28)

The inert portion of C&D materials (also called public fill) may be taken to public filling areas. Public filling areas usually form part of land reclamation schemes and are operated by the Civil Engineering and Development Department (CEDD). The *Land (Miscellaneous Provisions) Ordinance* requires that individuals or companies who deliver public fill to the public filling areas obtain Dumping Licences. The licences are issued by the CEDD under delegated authority from the Director of Lands.

Individual licences and windscreen stickers are issued for each vehicle involved. Under the licence conditions, public filling areas will accept only inert building debris, soil, rock and broken concrete. There is no size limit on rock and broken concrete, and a small amount of timber mixed with inert material is permissible. The material should, however, be free from marine mud, household refuse, plastic, metal, industrial and chemical wastes, animal and vegetable matter and any other materials considered unsuitable by the public filling supervisor.

7.2.4 Public Cleansing and Prevention of Nuisances Regulation

This *Regulation* provides further control on the illegal dumping of wastes on unauthorised (unlicensed) sites. The illegal dumping of wastes can lead to a fine and/or imprisonment.

7.2.5 Other Relevant Guidelines

Other 'guideline' documents, which detail how the project proponent or contractor should comply with the local regulations, are as follows:

- *Waste Disposal Plan for Hong Kong* (December 1989), Planning, Environment and Lands Branch Government Secretariat, Hong Kong Government;
- *Environmental Guidelines for Planning In Hong Kong* (1990), Hong Kong Planning Standards and Guidelines, Hong Kong Government;
- *New Disposal Arrangements for Construction Waste* (1992), EPD & CED, Hong Kong Government;
- *Code of Practice on the Packaging, Labelling and Storage of Chemical Wastes* (1992), EPD, Hong Kong Government;

- *Works Branch Technical Circular (WBTC) No. 32/92, The Use of Tropical Hard Wood on Construction Site*; Works Branch, Hong Kong Government;
- *WBTC No. 2/93, Public Dumps,* Works Branch, Hong Kong Government;
- *WBTC No. 2/93B, Public Filling Facilities*, Works Branch, Hong Kong Government;
- *Waste Reduction Framework Plan, 1998 to 2007*, Planning, Environment and Lands Bureau, Government Secretariat, 5 November 1998;
- *WBTC Nos. 25/99, 25/99A* and *25/99C, Incorporation of Information on Construction and Demolition Material Management in Public Works Sub-committee Papers*; Works Bureau, Hong Kong SAR Government;
- *WBTC No. 12/2000, Fill Management*; Works Bureau, Hong Kong SAR Government;
- *WBTC Nos. 6/2002 and 6/2002A, Enhanced Specification for Site Cleanliness and Tidiness.* Works Bureau, Hong Kong SAR Government;
- *WBTC No. 12/2002, Specification Facilitating the Use of Recycled Aggregates.* Works Bureau, Hong Kong SAR Government;
- *ETWBTC No. 33/2002, Management of Construction and Demolition Material Including Rock*; Environment, Transport and Works Bureau, Hong Kong SAR Government;
- *ETWBTC No. 31/2004, Trip Ticket System for Disposal of Construction & Demolition Materials*, Environment, Transport and Works Bureau, Hong Kong SAR Government; and
- *ETWBTC No. 19/2005*, *Environmental Management on Construction Sites*, Hong Kong SAR Government.

7.3 EXPECTED WASTE ARISINGS DURING THE CONSTRUCTION PHASE

During the construction phase, the main activities, which will potentially result in the generation of waste, include clearance of vegetation, construction of sub-structures and abutments of the new flyover, removal of existing road embankment and parapets, construction of subway, and reprofiling of existing barriers. The typical waste types associated with these activities include:

- construction waste;
- chemical waste;
- sewage; and
- general refuse.

It is anticipated that no waste will be arise during the operational phase of the Project, and therefore no operational impacts with implications on waste management is expected.

7.4 WASTE IMPACT ASSESSMENT

7.4.1 Construction & Demolition Materials

Construction and demolition (C&D) material would be generated from the following works of the Project:

- Clearance of existing vegetation to be affected by the works;
- Construction of retaining wall and flyover;
- Demolition of existing parapets or footing for existing noise barriers;
- Fill slope / slope reprofiling involved in road realignment; and
- Extension of subway under Left-Turn Lane A.

The key types of excavated and demolition materials expected to be generated during the construction works include excavated soil, fill and concrete. The total volume of the excavated and demolition materials currently estimated by HyD is approximately 33,000 m^3. A breakdown of the estimated quantities of excavated and demolition materials from the different types of works of the Project is presented in *Table 7.4a*.

Table 7.4a Summary of Excavation and Demolition Quantities

Road Segment / Associated Works	Description of Construction Works	Excavation Volume (m^3)	Demolition Volume (m^3)
Slip Road A	Construction of retaining walls	5,200	150
	Diverge from existing road (road widening)	600	50
Flyover A	Construction of the new flyover (including piling, pile caps and abutments)	3,500	150
Slip Road B	Construction of retaining walls	4,700	50
Slip Road C	Construction of retaining walls	10,400	100
	Reprofile existing slope	700	-
Left-turn Lane A	Construction of retaining walls and planter walls	1,400	-
	Construction of subway extension	400	-
	Removal of 1m high stem of the existing retaining wall	-	100
	Reconstruction of the existing road embankment with re-provision of planter wall at slope crest	1,000	-
	Reprofile of existing noise barrier	400	100
Road Resurfacing and Remarking A	Offsetting the kerb, extending the crossfall and resurfacing of carriageway	-	100
Road Resurfacing and Remarking B	Resurfacing of carriageway	-	100
Construction of 1m high noise barrier	Excavation and backfilling activities	2,600	-
Associated drainage, sewerage, water main and utilities works	Excavation and backfilling activities	500	100
Landscaping works	Excavation and backfilling activities	600	-
Total		***32,000***	***1,000***

The Project would require about 34,000 m^3 of soil/granular fill and 4,000 m^3 rock fill. The requirements for fill materials will be partly met by reusing the inert excavated materials generated from the Project itself. HyD has estimated that about 30% of the excavated materials are suitable for reuse on-site.

C&D materials would be generated mainly from the excavation of the existing road embankments or slopes and a portion of these materials could be used for re-profiling of the existing slopes. Opportunities for reusing the inert C&D material on-site for the retaining structures, which constitutes a key requirement for fill materials, have also been explored but found to be limited. As indicated in *Section 3.3.5*, earth reinforced retaining structures have been adopted for the construction of Slip Roads A and B taking into account the potential noise impacts on the surrounding sensitive receivers and the flexibility for working in the limited space available for the works. Specific considerations on the filling materials is required for the proposed earth reinforced retaining structure to satisfy the relevant design/performance requirements, such as the grading requirement of the selected fill. From the information provided by available ground investigation records, the site geology is complex and comprises fill materials, alluvium, Super-Karst Deposit and completely decomposed rock (Metamudstone/Metasiltone /Granodiorite). The construction works of the Project are expected to involve mainly excavation in the in-situ fill materials and alluvium. The variable properties and extent of the in-situ fill materials to be excavated and their clayey and silty properties would render them unsuitable for reuse as filling materials in the proposed retaining structures. The estimated 30% on-site reuse of excavated materials is therefore considered reasonable and achievable based on the adopted engineering design and the site-specific geological information.

The surplus inert C&D materials should be delivered to public fill facilities for reuse. Based on the trends observed in the data published by EPD in *Monitoring of Solid Waste in Hong Kong* and HyD's experience in similar previous projects, it is also estimated that about 10% of the demolition materials are C&D waste which would be disposed of at landfill. Based on the above, about 9,600 m^3 of excavation materials would be reused on site and about 23,300 m^3 of inert C&D materials would be disposed of to public fill reception facilities for other beneficial uses. Approximately 100 m^3 of non-inert materials generated from the excavation and demolition activities and about 400 m^3 of cleared vegetation would be disposed of as C&D waste to designated landfills or refuse transfer stations. As the engineering design of the Project is still ongoing, HyD will continue to explore opportunities for enhancing on-site reuse of excavated materials and for reducing the quantity of C&D waste for landfill disposal. HyD will maintain close liaison with EPD and the Public Fill Committee (PFC) in this regard. *Table 7.4b* summarises the estimated C&D materials arising and the associated disposal routes.

Table 7.4b Summary of Estimated Major C&D Material Arising and Disposal Route

	Total Quantities Generated	Quantities to be Reuse on-site (a)	Quantities to be Reuse in Public Fill Reception Facilities	Quantities to be Disposed of at Landfill (b)
Excavated materials	32,000 m^3	9,600 m^3	22,400 m^3 at Tuen Mun Area 38 Fill Bank or other approved public fill facilities	-
Demolition materials	1,000 m^3	-	900 m^3 at Tuen Mun Area 38 Fill Bank or other approved public fill facilities	100 m^3 at WENT Landfill or other approved designated landfill sites
Cleared vegetation	400 m^3	-	-	400 m^3 at WENT Landfill or other approved designated landfill sites
Total	***33,400 m^3***	***9,600 m^3***	***23,300 m^3***	***500 m^3***

Notes:

(a) It is anticipated that about 30% of the excavated materials are suitable to be reuse on-site.

(b) It is anticipated that about 10% of the demolition materials are C&D waste would be disposed of to designated landfills.

The majority of the C&D materials will be generated from the 4th month to the 21st month (tentatively from March 2010 to August 2011) as a result of the construction works for piles, retaining walls, new flyover and embankments. A sequential construction method will be used to facilitate the separation of inert and non-inert materials, as far as possible, to enable the beneficial use of the inert materials and to minimise waste disposal costs. Assuming a bulking factor of 1.4, it is estimated that about 13 truck trips will be required each day to dispose of the C&D materials (1) to the Tuen Mun Area 38 Fill Bank or other approved designated public fill facilities. The number of truck trips required to dispose of C&D waste to the West New Territories (WENT) Landfill or other approved designated landfill sites will be minimal owing to the relatively small volume of such materials expected to be generated over the entire construction phase. The delivery of the C&D materials to public fill reception facilities and landfills will be monitored using a trip ticket system implemented in accordance with *ETWB TCW No. 31/2004*.

7.4.2 Chemical Waste

Chemical waste, as defined under the *Waste Disposal (Chemical Waste) (General) Regulation*, includes any unwanted substances specified under *Schedule 1* of the *Regulation*. Substances likely to be generated from the construction of the Project may include:

- Residual paints and solvents; and
- Used lubricant oil from maintenance of the construction plant.

(1) Trucks per day = 23,300 m^3 of C&D materials to be disposed offsite x bulk factor 1.4 / 18 months / 24 days per month / 6 m^3 per truck = 12.5

(3) Based on DSD Sewerage Manual Part 1, domestic sewerage generated by employed population is 0.06 m^3/ day.

It is anticipated that the quantity of chemical waste to be generated will be small and in the order of a few hundred litres for whole construction phase. These chemical waste will be stored and disposed of in an appropriate manner, as outlined in the *Waste Disposal (Chemical Waste) (General) Regulation* and the *Code of Practice on the Packaging, Labelling and Storage of Chemical Wastes.*

7.4.3 Sewage

Sewage will arise from the construction workforce. It is estimated that a maximum of about 120 workers will be working at the site at any one time. The amount of sewage to be generated will be about 7.2 m^3 per day [3]. An adequate number of portable toilets will be provided at the site to ensure that sewage from site staff is properly collected. The portable toilets will be desludged and maintained regularly by a licensed contractor. No adverse environmental impacts are envisaged.

7.4.4 General Refuse

General refuse will be generated by the workforce. It is expected that the quantity of general refuse (mainly consisting of food waste, aluminium cans and waste paper) to be generated from the site staff will therefore be small (in the order of 78 kg per day [1]). Recyclable materials (ie paper, plastic bottles and aluminium cans) will be separated for recycling, in order to reduce the amount of general refuse to be disposed of at landfill.

The non-recyclable refuse will be placed in bags and stored in enclosed bins, and disposed of on a daily basis. This will avoid the occurrence of wind blown litter, odour, water quality impacts and vermin nuisance. The general refuse will be transported to the WENT Landfill or other approved designated landfill sites for disposal. No adverse environmental impact is envisaged.

Given that the quantity of general refuse to be disposed of at landfill is small, no adverse impact on the operation of the station is anticipated.

7.5 MITIGATION MEASURES

The assessment indicates that with the implementation of the proposed waste management practices at the work sites, no adverse environmental impacts are envisaged for the handling, collection and disposal of waste arising from the construction of the Project. No mitigation measures will be required.

This section further describes the good construction site practices to avoid or further reduce the potential environmental impacts associated with the handling, collection and disposal of construction and chemical wastes arising from the construction of the Project.

[1] Based on an assumption of the general refuse generated rate of workers of 0.65 kg/day/ capital

The Contractor must ensure that all the necessary waste disposal permits or licences are obtained prior to the commencement of the construction works. The Contractor should incorporate these recommendations into a Waste Management Plan (WMP) for the construction works. The Contractor should submit the plan to Project Proponent's Engineer Representative for endorsement prior to the commencement of the construction works. The plan should incorporate site-specific factors, such as the designation of areas for the segregation and temporary storage of reusable and recyclable materials.

It will be the Contractor's responsibility to ensure that only reputable licensed waste collectors are used and that appropriate measures to reduce adverse impacts, including windblown litter and dust from the transportation of these wastes, are employed. In addition, the Contractor must ensure that all the necessary permits or licences required under the *Waste Disposal Ordinance* are obtained for the construction phase.

Waste Management Hierarchy

The various waste management options are categorised in terms of preference from an environmental viewpoint. The options considered to be most preferable have the least environmental impacts and are more sustainable in the long term. The hierarchy is as follows:

- Avoidance and reduction;
- Reuse of materials;
- Recovery and recycling; and
- Treatment and disposal.

The above hierarchy has been used to evaluate and select waste management options. The aim has been to reduce waste generation and reduce waste handling and disposal costs.

The Contractor should consult the EPD for the final disposal of wastes and implement the following good site practices and mitigation measures:

Waste Reduction Measures

Good management and control can prevent generation of significant amount of waste. Waste reduction is best achieved at the planning and design stage, as well as by ensuring the implementation of good site practices. Recommendations to achieve waste reduction include:

- Segregation and storage of different types of waste in different containers, skips or stockpiles to enhance reuse or recycling of material and their proper disposal;

- Encourage collection of aluminium cans and waste paper by individual collectors during construction with separate labelled bins being provided to allow the segregation of these wastes from other general refuse generated by the workforce;

- Any unused chemicals and those with remaining functional capacity be recycled as far as possible;

- Use of reusable non-timber formwork to reduce the amount of C&D materials;

- Prior to disposal of construction waste, wood, steel and other metals should be separated, to the extent practical for re-use and/or recycling to reduce the quantity of waste to be disposed at landfills;

- Proper storage and site practices to reduce the potential for damage or contamination of construction materials; and

- Plan and stock construction materials carefully to reduce amount of waste generated and avoid unnecessary generation of waste.

7.5.1 Construction Waste

Wherever practicable, the excavated soil will be segregated from other wastes to avoid contamination, and reused on-site for filling to reduce the amount of construction waste to be disposed off-site.

Good site practices during the construction activities would avoid adverse waste management related. Recommendations for good site practices during the construction activities include:

- Nomination of an approved person, such as a site manager, to be responsible for good site practices, arrangements for collection and effective disposal to an appropriate facility, of all wastes generated at the site.

- Training of site personnel in proper waste management and chemical waste handling procedures.

- Provision of sufficient waste disposal points and regular collection for disposal.

- Appropriate measures to minimise windblown litter and dust during transportation of waste by either covering trucks or by transporting wastes in enclosed containers.

- Regular cleaning and maintenance programme for drainage systems, sumps and oil interceptors.

- A recording system for the amount of wastes generated, recycled and disposed of (including the disposal sites).

7.5.2 Management of Waste Disposal

The construction contractor will open a billing account with the EPD in accordance with the *Waste Disposal (Charges for Disposal of Construction Waste) Regulation*. Every construction waste or public fill load to be transferred to the Tuen Mun Area 38 Fill Bank or other approved designated public fill facilities will require a valid "chit".

A trip-ticket system will also be established in accordance with *Works Bureau Technical Circular No.31/2004* to monitor the disposal of construction waste at the Tuen Mun Area 38 Fill Bank or other approved designated public fill facilities, and to control fly-tipping. The trip-ticket system will be included as one of the contractual requirements and implemented by the contractor.

7.5.3 Chemical Waste

The construction contractor will be registered as a chemical waste producer with the EPD. Chemical waste will be handled in accordance with the *Code of Practice on the Packaging, Handling and Storage of Chemical Wastes.* Containers used for the storage of chemical wastes should:

- Be suitable for the substance they are holding, resistant to corrosion, maintained in a good condition, and securely closed;
- Have a capacity of less than 450 L unless the specifications have been approved by the EPD; and
- Display a label in English and Chinese in accordance with instructions prescribed in Schedule 2 of the Regulations.

The storage area for chemical wastes will:

- Be clearly labelled and used solely for the storage of chemical waste;
- Be enclosed on at least 3 sides;
- Have an impermeable floor and bunding, of capacity to accommodate 110% of the volume of the largest container or 20% by volume of the chemical waste stored in that area, whichever is the greatest;
- Have adequate ventilation;
- Be covered to prevent rainfall entering (water collected within the bund must be tested and disposed of as chemical waste, if necessary); and
- Be arranged so that incompatible materials are appropriately separated.

Chemical waste should be collected by a licensed chemical waste collector to a facility licensed to receive chemical waste, such as the Chemical Waste Treatment Facility.

7.5.4 Staff Training

At the commencement of the construction works, training will be provided to workers on the concepts of site cleanliness and on appropriate waste management procedures, including waste reduction, reuse and recycling.

7.5.5 Summary of Waste Handling Procedures and Disposal Routes

The summary of the various waste types likely to be generated during the construction works for the Project, together with the recommended handling and disposal methods are summarized in *Table 7.5a*.

Table 7.5a Summary of Waste Handling Procedures and Disposal Routes

Waste material type	Total quantities generated	Quantities to be reuse on-site	Quantities to be disposed off-site	Proper handling procedures	Disposal
C&D Materials	32,900 m^3 of inert C&D materials and 500 m^3 of C&D waste	9,600 m^3 of inert C&D materials reuse on-site for filling	23,300 m^3 of inert C&D materials and 500 m^3 of C&D waste	Handle in accordance with good site practices and sorting of inert C&D material (public fill) and C&D waste onsite.	Inert C&D materials send to public filling are for other beneficial uses; C&D waste for disposal of at landfill.
Chemical Waste	Few hundred litre for whole construction phase	-	Few hundred litre	Handle in accordance with *the Code of Practice on the Packaging, Handling and Storage of Chemical Wastes* and collect by licensed chemical waste collectors.	Chemical Waste Treatment Centre
Sewage	7.2 m^3 per day	-	7.2 m^3 per day	Portable toilets will be desludged and maintained regularly by licensed contractor	To be collected by licensed sewage collector for treatment
General Refuse	78 kg per day	-	78 kg per day	Provide on-site refuse collection points waste segregation.	To be collected by licensed waste collector for disposal of at landfill.

7.6 *RESIDUAL ENVIRONMENTAL IMPACTS*

No residual waste management impact is envisaged after the completion of the Project construction works.

7.7 *LAND CONTAMINATION*

Potential land contamination issues for all land lots/sites within the Study Area are considered below. Past and present activities or land uses that may cause land contamination problems are assessed.

The assessment is undertaken in accordance with Clause 3.4.4.2 (iii) of the *EIA Study Brief, Annex 19* of the EIAO-TM and *Guidance Note for Contaminated Land Assessment and Remediation* issued by *EPD* in 2007.

7.7.1 Assessment Methodology

The objective of this assessment is to evaluate and identify the potential land contamination associated with the past and present activities or land uses within the Study Area and develop an assessment plan to determine the extent of any contamination present, if required. To achieve the objective, a desktop study to review the past and present activities or land uses within the Study Area and an assessment on any potential environmental impacts arising as a result of historical land contamination or during future use of the proposed new roads were undertaken.

7.7.2 Desktop Study

A desktop study was conducted to review past and present land uses, activities and installations within the Study Area and its vicinity that may have the potential to cause land contamination. The following sources of information were collected and reviewed:

- Hong Kong Topographic Survey maps (1:1000, 1:5000 and 1:10,000) from 1967 to present, Survey and Mapping Office, Lands Department;
- *Hong Kong Geological Survey* (*Sheet 6, Series HGM 20, Edition I – 1988*), Survey and Mapping Office, Lands Department;
- Selected aerial photographs of the Site and its surrounding areas from 1964 onwards; and
- Selected historical photographs of the Study Area and its surrounding areas in the archives of Hong Kong Public Library (HKPL).

7.7.3 Site History

A review of the site history was conducted based on the examination and analysis of selected aerial photographs and survey maps of the Study Area. Selected aerial photographs taken in 1964, 1973, 1983, 1993, 1995, 1996, 1998, 2005 and 2007 and survey maps published since 1967 of the Study Area were reviewed. A list of relevant aerial photographs reviewed is presented in *Table 7.7a.*

Table 7.7a Aerial Photographs Reviewed

Date of Photograph	Lands Department Reference No.	Height (Feet)	Observations
16 December 1964	3268	1800	View of Yuen Long. The Study Area was used for agriculture. Agricultural fields and ponds were found.
20 February 1973	3419	3000	View of Yuen Long. The Study Area was used for agriculture. Agricultural fields, ponds and squatter huts were found. Castle Peak Road was in place.
26 September 1983	49474	3000	View of Yuen Long. The Study Area was used for agriculture. Agricultural fields, ponds, squatter huts and high-rise buildings were found. Foot bridge crossing Castle Peak Road was in place.
28 May 1993	CN3435	3000	View of Pok Oi Interchange. The roundabout and slip roads to the south of roundabout were under construction. A school was located in the proposed Left-Turn Lane A area.
19 July 1995	CN10237	3200	View of Pok Oi Interchange. The roundabout and slip roads to the south of roundabout were in place.
31 October 1996	CN15287	3000	View of Pok Oi Interchange. The slip roads to the north of the roundabout were under construction.
10 July 1998	CN19928	3000	View of Pok Oi Interchange. The slip roads to the north of the roundabout were in place. Yuen Long Highway was under construction. The school located in the proposed Left-Turn Lane A area had been demolished and the area was used as for accommodating a construction site office.
07 May 2005	CW65272	2500	View of Pok Oi Interchange. West Rail was in operation. YOHO Town Phase I was occupied while Phase II was under construction. Kwong Ming Ying Loi School was under construction. Part of the proposed Left-Turn Lane A area was paved and used for vehicle parking.
25 July 2007	CW77365	3000	View of Pok Oi Interchange. Kwong Ming Ying Loi School was in use. Proposed Left-Turn Lane A area was no longer used for vehicle parking.

Source of Aerial Photographs: Survey and Mapping Office, Lands Department

Historically, the Study Area was mostly agricultural fields and ponds. Scattered squatter huts were found. The most prominent change to the land uses within the Study Area was the construction of POI. POI with its slip roads and YLH have been in place since 1993 and 1998, respectively.

From the historical aerial photographs and Hong Kong Topographic Survey maps examined, part of the area for the proposed Left-Turn Lane A was a school before 1996. The school was demolished and the land was paved and

used for a construction site office from 1998 and vehicle parking from 2002, respectively. A site visit undertaken on 12 October 2007 found that the area was fenced off, signed as Government Land and no longer used for car parking.

7.7.4 Geology and Superficial Deposits

Hong Kong Geological Survey (Sheet 6, Series HGM 20, Edition I – 1988) shows that the Study Area is underlain by Holocene alluvium and Holocene mainly undivided dark grey marine mud of Hang Hau Formation of the Quaternary age.

From the historical photographs examined, the Study Area was shown to be within the works boundary of YLH in 1998. The natural solid and superficial deposits would have been disturbed by the construction activities of YLH. It is therefore believed that further impact from the Project on the same deposits will be minimal.

7.7.5 Existing Land uses

According to Hong Kong topographic survey maps published by the Lands Department, the existing land uses in the Study Area, excluding the area for the proposed Left-Turn Lane A, were roads and highways. The land uses within these areas have not changed since the completion of POI and YLH.

As for the area for the proposed Left-Turn Lane A, the land was allocated as Government Land and zoned "Undetermined" in the latest OZP.

7.7.6 Potential Impacts

The review of past and present land uses of the Study Area indicates that the area, except that for the proposed Left-Turn Lane A, has been used for roads and highways since 1995. Based on the fact that the Project will not extend beyond the existing road reserve, land contamination is not expected to be a concern.

For the area in which the proposed Left-Turn Lane A will be located, it was paved with hardstanding during its previous uses as a construction site office and car park. The potential for land contamination is also considered low.

Based on the above, it is anticipated that contaminated materials would not be encountered during the construction of the Project and implications with respect to construction worker exposure to contaminated materials and contaminated material disposal are not expected.

7.8 ENVIRONMENTAL MONITORING AND AUDIT

To facilitate monitoring and control over the Contractor's environmental performance in terms of waste management, a waste monitoring and audit programme should be implemented during the construction phase. The aims of the monitoring and audit programme are:

- To review the Contractor's Waste Management Plan (WMP) including the quantities and types of C&D materials generated, reused and disposed of off-site; the amount of fill materials exported from/imported to the Site and the quantity of timber used in temporary works construction for each process/activity;

- To monitor the implementation and achievement of the WMP on-site to assess its effectiveness; and

- To monitor the follow-up actions for deficiencies identified.

Joint site audits by the Environmental Team and the Contractor should be undertaken on a regular basis. Particular attention should be given to the Contractor's provision of sufficient spaces, adequacy of resources and facilities for on-site sorting and temporary storage of C&D material. The C&D materials to be disposed of from the Project should be visually inspected. The public fill for delivery to off-site stockpiling areas should contain no observable non-inert materials (eg, general refuse, timber, etc). Furthermore, the waste to be disposed of at refuse transfer stations or landfills should as far as possible contains no observable inert or reusable/recyclable C&D materials (eg, soil, broken rock, metal, and paper/cardboard packaging, etc). Any irregularities observed during the regular site audits should be raised promptly to the Contractor for rectification.

To facilitate assessment of the effectiveness of the waste management measures, the WMP should state the performance targets to be achieved in reducing generation of C&D materials taking account of the Site constraints. The performance targets should cover the following items and should be agreed with HyD at the beginning of the Contract.

- The percentage of excavated materials to be sorted to recover the soil and broken rock for reuse on site or deliver to the off-site stockpiling area;

- The percentage of metal to be recovered for collection by recycling contractors; and

- The percentage of cardboard and paper packaging (for plant, equipment and materials) to be recovered. The recovered materials will be properly stockpiled in dry and covered condition to prevent cross contamination by other wastes.

The findings of the waste audits should be reported in regular Environmental Monitoring and Audit (EM&A) Reports.

7.9 CONCLUSIONS

The quantities of construction waste, chemical wastes, sewage and general refuse to be generated during the construction phase of the Project are expected be small. With the implementation of general good construction site practices, the construction of the Project will not cause adverse waste

management or environmental impacts. Waste arisings, which are expected to comprise silt or grit removed from road gullies and litter collected from road surface, during the operational phase will be minimal and will not cause any environmental impact.

Based on the desktop studies and site inspection undertaken, no contaminated sites were identified in the vicinity of the Project. A small area in which the proposed Left-Turn Lane will be located was found to have been used a construction site office and vehicle parking. During both the above uses, the area was paved. Based on the above, the potential for land contamination and impacts upon site workers during the construction of the Project is considered to be insignificant and no adverse environmental impacts associated with land contamination are anticipated. No further investigations are considered necessary.

8 LANDSCAPE AND VISUAL IMPACT ASSESSMENT

8.1 INTRODUCTION

This *Section* presents the Landscape and Visual Impact Assessment (LVIA) for the construction and operation of the Proposed Improvement to Pok Oi Interchange (POI).

8.2 ASSESSMENT METHODOLOGY

In accordance with *EIAO Guidance Note No. 8/2002*, the main components of the LVIA are as follows:

- Description of the Project;
- Review of the planning and development control framework;
- Tree survey results;
- Baseline study of landscape character, landscape resources and also visual resources such as key views and the visual character and amenity of the Study Area;
- Landscape impact assessment during construction and operation of the Project;
- Visual impact assessment during construction and operation of the Project;
- Recommendations for landscape and visual mitigation measures for both the construction and operation phases; and
- Assessment of the residual impacts and conclusion on the acceptability of the Project.

8.3 PROJECT DESCRIPTION

The Proposed Improvement to the POI will comprise the construction of slip roads, a left-turn lane and a flyover and the resurfacing and re-marking of road sections at the POI.

The detailed description is provided in *Section 2* and the proposed alignment of the Project is shown in *Figure 2.1a*.

8.4 LEGISLATION REQUIREMENTS AND EVALUATION CRITERIA

The LVIA was undertaken in accordance with the guidelines and requirements stipulated in *Annexes 10* and *18* of the *EIAO-TM* under the *EIAO* (Cap.499, S16), entitled "Criteria for Evaluating Visual and Landscape Impact" and "Guidelines for Landscape and Visual Impact Assessment", respectively and the *EIAO Guidance Note No. 8/2002* "*Preparation of Landscape and Visual Impact Assessment Under the Environmental Impact Assessment Ordinance*." The landscape assessment considers the potential impacts of the Project on the existing landscape and particularly on the landscape resources within 100m of the Project Site.

The visual assessment analyses the potential visual impacts of the Proposed Improvement to the POI on the existing views and the visual amenity, particularly from the Visually Sensitive Receivers (VSR) within the viewshed (sometimes referred to as the Zone of Visual Influence (ZVI). This report will use the term "viewshed". In order to illustrate the visual impacts of the development, photomontages prepared from selected viewpoints compare the existing conditions with the view after commissioning. The residual impacts are evaluated qualitatively, in accordance with the requirements of *Annex 10* of the *EIAO-TM*.

8.5 PLANNING

The surroundings of the existing POI are varied in nature, containing scattered village houses, school, hospital, home of the aged, new high-rise residential developments, and unoccupied open spaces. The proposed improvement works is located within the Outline Zoning Plans (OZP) for Yuen Long (No.S/YL/17), Nam Sang Wai (No.S/YL-NSW/8) and Tai Tong (No.S/YL-TT/14), the land uses to the surrounding areas of the Project were zoned as "Open Space" (O), "Government/Institution/Community" (GIC), "Comprehensive Development Area" (CDA), "Village Type Development" (V), "Undetermined" (U) and "Agriculture" (AGR) (*Figures 4.3a* to *4.3c*).

The objective of the Project is to relieve the current traffic pressures at the POI. This Project represents an improvement to the existing POI and therefore is not considered to have potential conflicts with the Planning Intention of this OZP.

8.6 TREE SURVEY

A broad brush tree survey was undertaken for the Project. A total of approximately 670 trees were identified. Details of the tree survey are presented in *Annex E*.

Methodology

Topographical surveys, including identification of the location of the trees, were undertaken by HyD. The tree survey was undertaken within the Project Site in accordance with *Section 3.4.5.4* of *EIA Study Brief No. ESB-138/2006*, the guideline from *ETWB TCW Nos. 3/2006*, *55/2002*, *2/2004*, *LAO Practice Note Nos. 6/2000* and *8/2002*.

The most commonly occurring tree species include *Acacia confusa, Acacia mangium, Casuarina equisetifolia* and *Bauhinia* spp.

The canopy heights range from 5 to 10 m, with the canopy width ranging from 3 to 10 m. Generally the trunk Diameter at Breast Height (DBH) was 100 to 450 mm

As the detailed design of the proposed works is not yet available at this stage, the number of trees to be retained, transplanted and removed are estimated based on the preliminary design of the proposed works. The estimated numbers would be updated in the tree removal application to be prepared and submitted to the Lands Department for approval in the detailed design stage in accordance with *ETWB TCW No. 3/2006*.

8.7 LANDSCAPE IMPACT ASSESSMENT

8.7.1 Methodology

In accordance with *Annex 18* of the *EIAO-TM*, the landscape impact assessment will cover the following:

- Describe the baseline landscape within 100m of the Project Site and the works area of the enabling works along the access routes.
- Describe the Landscape Character Areas (LCAs) and Landscape Resources (LRs) including describing edges as different LRs.
- Map the distribution of the LCAs and LRs.
- Propose a qualitative and quantitative assessment of significant thresholds which reflect the magnitude of change and sensitivity to change of a particular LCAs and LRs.
- Analyse the landscape impacts during construction, impact after development, and off-site landscape impacts. This section analyses the extent to which these landscape units and edges are changed, using both quantitative and qualitative assessments.
- Examine landscape measures that will contribute to reducing any landscape impacts or will enhance the landscape associated with the Proposed Improvement to the POI. This may include planting, new landscaped areas and re-vegetation. The residual landscape impacts are also analysed.

- Provide conclusions on the impacts of the Project.

8.7.2 Baseline Landscape Conditions

As specified by the EIA Study Brief, the area for the Landscape Impact Assessment covers the area within 100m of the proposed works. The landscape baseline study examines the potential impacts on the Project Site and surrounding areas in terms of both the LCAs and the LRs.

The LCAs and LRs of the Study Area have been categorised according to the presence of common elements. These include factors such as:

- Topography;
- Vegetation type (both species and age);
- Built forms;
- Evidence on human modifications;
- Land use (past and present); and
- Edges.

8.7.3 General Landscape Description

The baseline landscape character of surroundings of the POI is dominated by both urban and rural characteristics. Scattered around the Site are village houses and disturbed areas including open storage and open carparks. Roadside plantation exists along most of the Yuen Long Highway and Castle Peak Road sections near the Site. An area of agricultural land and a nullah is located along one side of the Yuen Long Highway on the south of the Pok Oi Roundabout (POR).

The topography of the area is generally flat with a number of developed areas with urban structures of moderate height including a care home, a school and a wholesale market.

8.7.4 Landscape Sensitivity

An understanding of the sensitivity to change of the LCAs and LRs is important when analysing the overall landscape impact of the Proposed Improvement to the POI upon the LCAs and LRs.

Factors affecting the sensitivity of change for evaluation of landscape are:

- Quality of LCAs and LRs;
- Importance and rarity of special landscape elements;
- Ability of the landscape to accommodate change;

- Significance of the change in the local and regional context; and
- Maturity of the landscape.

The degree of sensitivity of the LCAs and LRs is classified as follows:

i) High – eg;. important components or landscape of particularly distinctive character susceptible to small changes;

ii) Medium – eg; a landscape of moderately valued characteristics reasonably tolerant to change; and

iii) Low – eg; a relatively unimportant landscape which is able to accommodate extensive change.

The following section describes each of the LCAs and LRs within the Study Area.

8.7.5 Landscape Character Areas

The Landscape Character Map of Hong Kong identifies three different Landscape Character Types within the Study Area. These Landscape Character Types have been adopted as the Landscape Character Areas (LCAs) for the Study. The location of these LCAs is shown in *Figure 8.7a* and the impact on these LCAs is shown in *Figure 8.7b.*

LCA1 – Miscellaneous Rural Fringe Landscape

Figure 8.7c Miscellaneous Rural Fringe Landscape

This LCA is characterised by the agricultural area to the south-east of the site and a portion of the nullah. This LCA is of medium quality, with a low-medium ability to accommodate change, mainly due to the natural/farming elements present. The sensitivity of this LCA is considered to be *moderate.*

LCA2 – Miscellaneous Urban Fringe Landscape

Figure 8.7d Miscellaneous Urban Fringe Landscape

This LCA is characterised by the semi-developed and disturbed areas of land. These areas contain some developments but in no discernable pattern. This LCA has a high ability to accommodate change, has a low significance and is generally an immature landscape. The sensitivity of this LCA is considered to be *low*.

Figure 8.7e Urban Peripheral Village Landscape

This LCA is comprised of a portion of the Wong Uk Tsuen village area. This area is characterised by low rise village style development in an organic layout. It has a high ability to accommodate change, and a low significance as these areas are common on the broader context. The sensitivity of this LCA is considered to be *low*.

8.7.6 Landscape Resources

Seven LRs have been identified. The location of these LRs is shown in *Figure 8.7f* and the impact on these LRs is shown in *Figure 8.7g.*

LR 1 – Roads

Figure 8.7h Roads

The road area is comprised of the Yuen Long Highway that dissects the study area in a north-south direction, and the Castle Peak Road in an east-west direction. The typical associated infrastructure includes lighting, signage etc. This LR can easily accommodate change, is very common and has no regional significance. The sensitivity of the Road is considered to be *low*.

LR 2 – Agricultural Land

Figure 8.7i Agricultural Land

A small area of agricultural land is located at the south-east of the POI. The LR can moderately accommodate change, has a low maturity. However it is relatively un-common in the study area and in the broader regional context. The sensitivity of the Agricultural land is therefore considered to be *medium.*

LR 3 – Roadside Plantation

Figure 8.7j Roadside Plantation

The LR refers to the existing mature buffer planting along the Yuen Long Highway and the Castle Peak Road which provides good screening effect and enhances the overall landscape quality of the surrounding environment. This LR is very common and has low regional significance. This LR can accommodate change and the sensitivity is considered to be *medium.*

LR 4 – Developed Area

Figure 8.7k ***Developed Area***

The developed area consists comprises of the Kwong Ming Ying Loi School, the Pond Fish Wholesale Market and a section of the Jockey Club Care and Attention Home. The LR is very common in the region, with low landscape value and can easily accommodate change. This LR is considered to have *low* sensitivity.

LR 5 – Disturbed Area

Figure 8.7l Disturbed Area

The Disturbed Area consists of an open depot, concrete paved or unpaved open spaces with scattered vegetation and construction sites. This LR can easily accommodate change, is very common in the region and is of low landscape quality. The sensitivity of the Disturbed Area is *low.*

LR 6 – Nullah

Figure 8.7m Nullah

A nullah runs almost parallel along a section of the Yuen Long Highway. This nullah branches from the outfall of the Kam Tin River and has been artificially channelised. In dry seasons, water fills up the narrow section of the nullah in the middle, exposing vegetation on the broad base of the nullah. During the wet season, higher flows in the nullah may cover the vegetation, exposing only the concrete embankment. This LR is relatively common in this region, it can accommodate change and has a moderate landscape value. The sensitivity of the nullah is considered to be *low.*

LR 7 – Village

Figure 8.7n Village

Several villages including Wong Uk Tsuen and Small Traders New Village are located in the surround areas. The village areas are highly developed and dominated by blocks of village houses, concrete paths, landscaped areas and fenced off abandoned lands occupied by weeds and construction materials.

This LR is relatively common in the region and can accommodate change, and is generally of low landscape quality. The sensitivity of the Village area is considered to be *low*.

8.7.7 Distribution of LCAs and LRs

Table 8.7a Landscape Character Areas (LCAs) and Landscape Resources (LRs)

ID	LCA/LR	Area (hectare)/ Length (km) Within Study Area
LCA 1	Miscellaneous Rural Fringe Landscapes	8.55ha
LCA 2	Miscellaneous Urban Fringe Landscapes	17.97ha
LCA 3	Urban Peripheral Village Landscapes	4.48ha
LR 1	Roads	2.56ha
LR 2	Agricultural Land	1.91ha
LR 3	Roadside Plantation	3.23ha
LR 4	Developed Area	1.39ha
LR 5	Disturbed Area	7.68ha
LR 6	Nullah	10.52ha
LR 7	Village	3.71ha

8.7.8 Landscape Impacts During Construction

The two key factors that affect the evaluation of LCA and LR impacts are the magnitude of change and the sensitivity of the landscape areas/resources. The sensitivity to change for each of the LCAs and LRs has been described above and the factors affecting the magnitude of change are outlined below.

Factors affecting the magnitude of change for assessing landscape impacts are:

- Compatibility of the Proposed Improvement to POI with the surrounding landscape, ie how well will it fit with its surrounds;
- Scale of the development, ie how big is the development relative to its surroundings, and;
- Reversibility of change. ie to how easily the changes to the landscape can be reversed.
- The magnitude of change is classified as follows:
- Large – notable change in the landscape characteristics over an extensive area ranging to very intensive change over a more limited area;
- Intermediate – moderate changes to a local area;
- Small – changes to specific landscape components; and
- Negligible – no substantial changes to the baseline condition.

The landscape impact is a product of the magnitude of change that the Project will have and the sensitivity of the LR. *Table 8.7b* shows the significance threshold of the LR impacts.

Table 8.7b Significance Threshold of Potential Landscape Resource Impact

		Sensitivity to Change		
Magnitude of Change Caused by Project		**Low**	**Medium**	**High**
	Large	Moderate Impact	Moderate/Significant Impact	Significant Impact
	Intermediate	Slight/Moderate Impact	Moderate Impact	Moderate/ Significant Impact
	Small	Slight Impact	Slight/Moderate Impact	Moderate Impact
	Negligible	Negligible Impact	Negligible Impact	Negligible Impact

Table 8.7c provides some definitions of the significance thresholds for LR and LCA impacts.

Table 8.7c Adverse / Beneficial Impact of Landscape Impact

Level of Impacts (Negative / Beneficial/ Neither)			
Significant:	**Moderate:**	**Slight:**	**Negligible**
Adverse / beneficial impact where the Project would cause significant degradation or improvement in existing landscape baseline conditions	Adverse / beneficial impact where the Project would cause noticeable degradation or improvement in existing landscape baseline conditions	Adverse /beneficial impact where the Project would cause a barely noticeable degradation or improvement in existing landscape conditions or where the changes brought about by the Project would not be apparent in visual terms	The Project does not affect the existing landscape baseline conditions

8.7.9 Unmitigated Landscape Impacts During Construction

Table 8.7d shows the impact of the Project on each of the LRs and LCAs and the overall impact based on the preceding Landscape Impact Assessment Matrix.

Table 8.7d Unmitigated Landscape Impact Significance Threshold Matrix

ID	LR/LCA	Area / Length	Area Affected by the Project	% of Area / Length Affected	Sensitivity to Change	Magnitude of Change	Significance Threshold of Landscape Impact
LCA 1	Miscellaneous Rural Fringe Landscapes	8.55	0.69	8.1%	Moderate	Small	Moderate
LCA 2	Miscellaneous Urban Fringe Landscapes	17.97	0.96	5.3%	Low	Small	Slight
LCA 3	Urban Peripheral Village Landscapes	4.48	Nil	0%	Low	Negligible	Negligible
LR 1	Roads	2.56	0.14	5.4%	Low	Small	Slight
LR 2	Agricultural Land	1.91	Nil	0%	Moderate	Negligible	Negligible
LR 3	Roadside Plantation	3.23	1.46	45.2%	Moderate	Large	Moderate
LR 4	Developed Area	1.39	Nil	0%	Low	Negligible	Negligible
LR 5	Disturbed Area	7.68	0.05	0.7%	Low	Negligible"	Negligible"
LR 6	Nullah	10.52	Nil	0%	Low	Negligible"	Negligible"
LR 7	Village	3.71	Nil	0%	Low	Negligible"	Negligible"

8.7.10 Summary of Un-mitigated Impacts on Landscape Resources

LR 1 – Roads

The road has low sensitivity due to the common nature in the surrounding region and the high ability to accommodate change. However, the close proximity to the Project Site impose a small but intermediate magnitude of change this LR. The significance threshold is therefore *slight adverse.*

LR 2 – Agricultural Land

The agricultural land is of medium sensitivity, with the negligible magnitude of change expected as a result of the Project, the significance threshold of landscape impact is also *negligible.*

LR 3 – Roadside Plantation

The roadside plantation is considered to have a medium sensitivity. The immediate proximity of the Project Site, approximately 45.2% of this LR will be affected, resulting in significance threshold of *moderate Adverse.*

LR 4 – Developed Area

The developed area is very common in the region, with no landscape value and can easily accommodate change. The Project will not impose changes to this LR, and with the low sensitivity the significance threshold is considered to be *negligible.*

LR 5 – Disturbed Area

A very small proportion of the disturbed area will be affected by the Project Site. With its low landscape quality and sensitivity, the significance threshold of this LR is *negligible.*

LR 6 – Nullah

The nullah has a low sensitivity due its ability to accommodate change and commonality in the region. The Project Site will not impose magnitude of change to this LR. The significance threshold of the nullah is *negligible.*

LR 7 – Village

Due to the relatively long distance between the nullah and the Project Site, the Project will not impose changes to this LR. With the low sensitivity of this LR, the significance threshold is *negligible.*

8.7.11 Landscape Mitigation Measures

Landscape Mitigation Measures are proposed to not only further reduce these impacts but to generally improve the amenity of the Project.

LMM 1 – Soil stabilisation and planting. During the design phase, a soil stabilisation and embankment planting strategy will be developed to ensure that land affected by slope excavation can be replanted. Soil preparation and the selection and provision of suitable growing medium is to be completed in accordance with the relevant best practice guidelines.

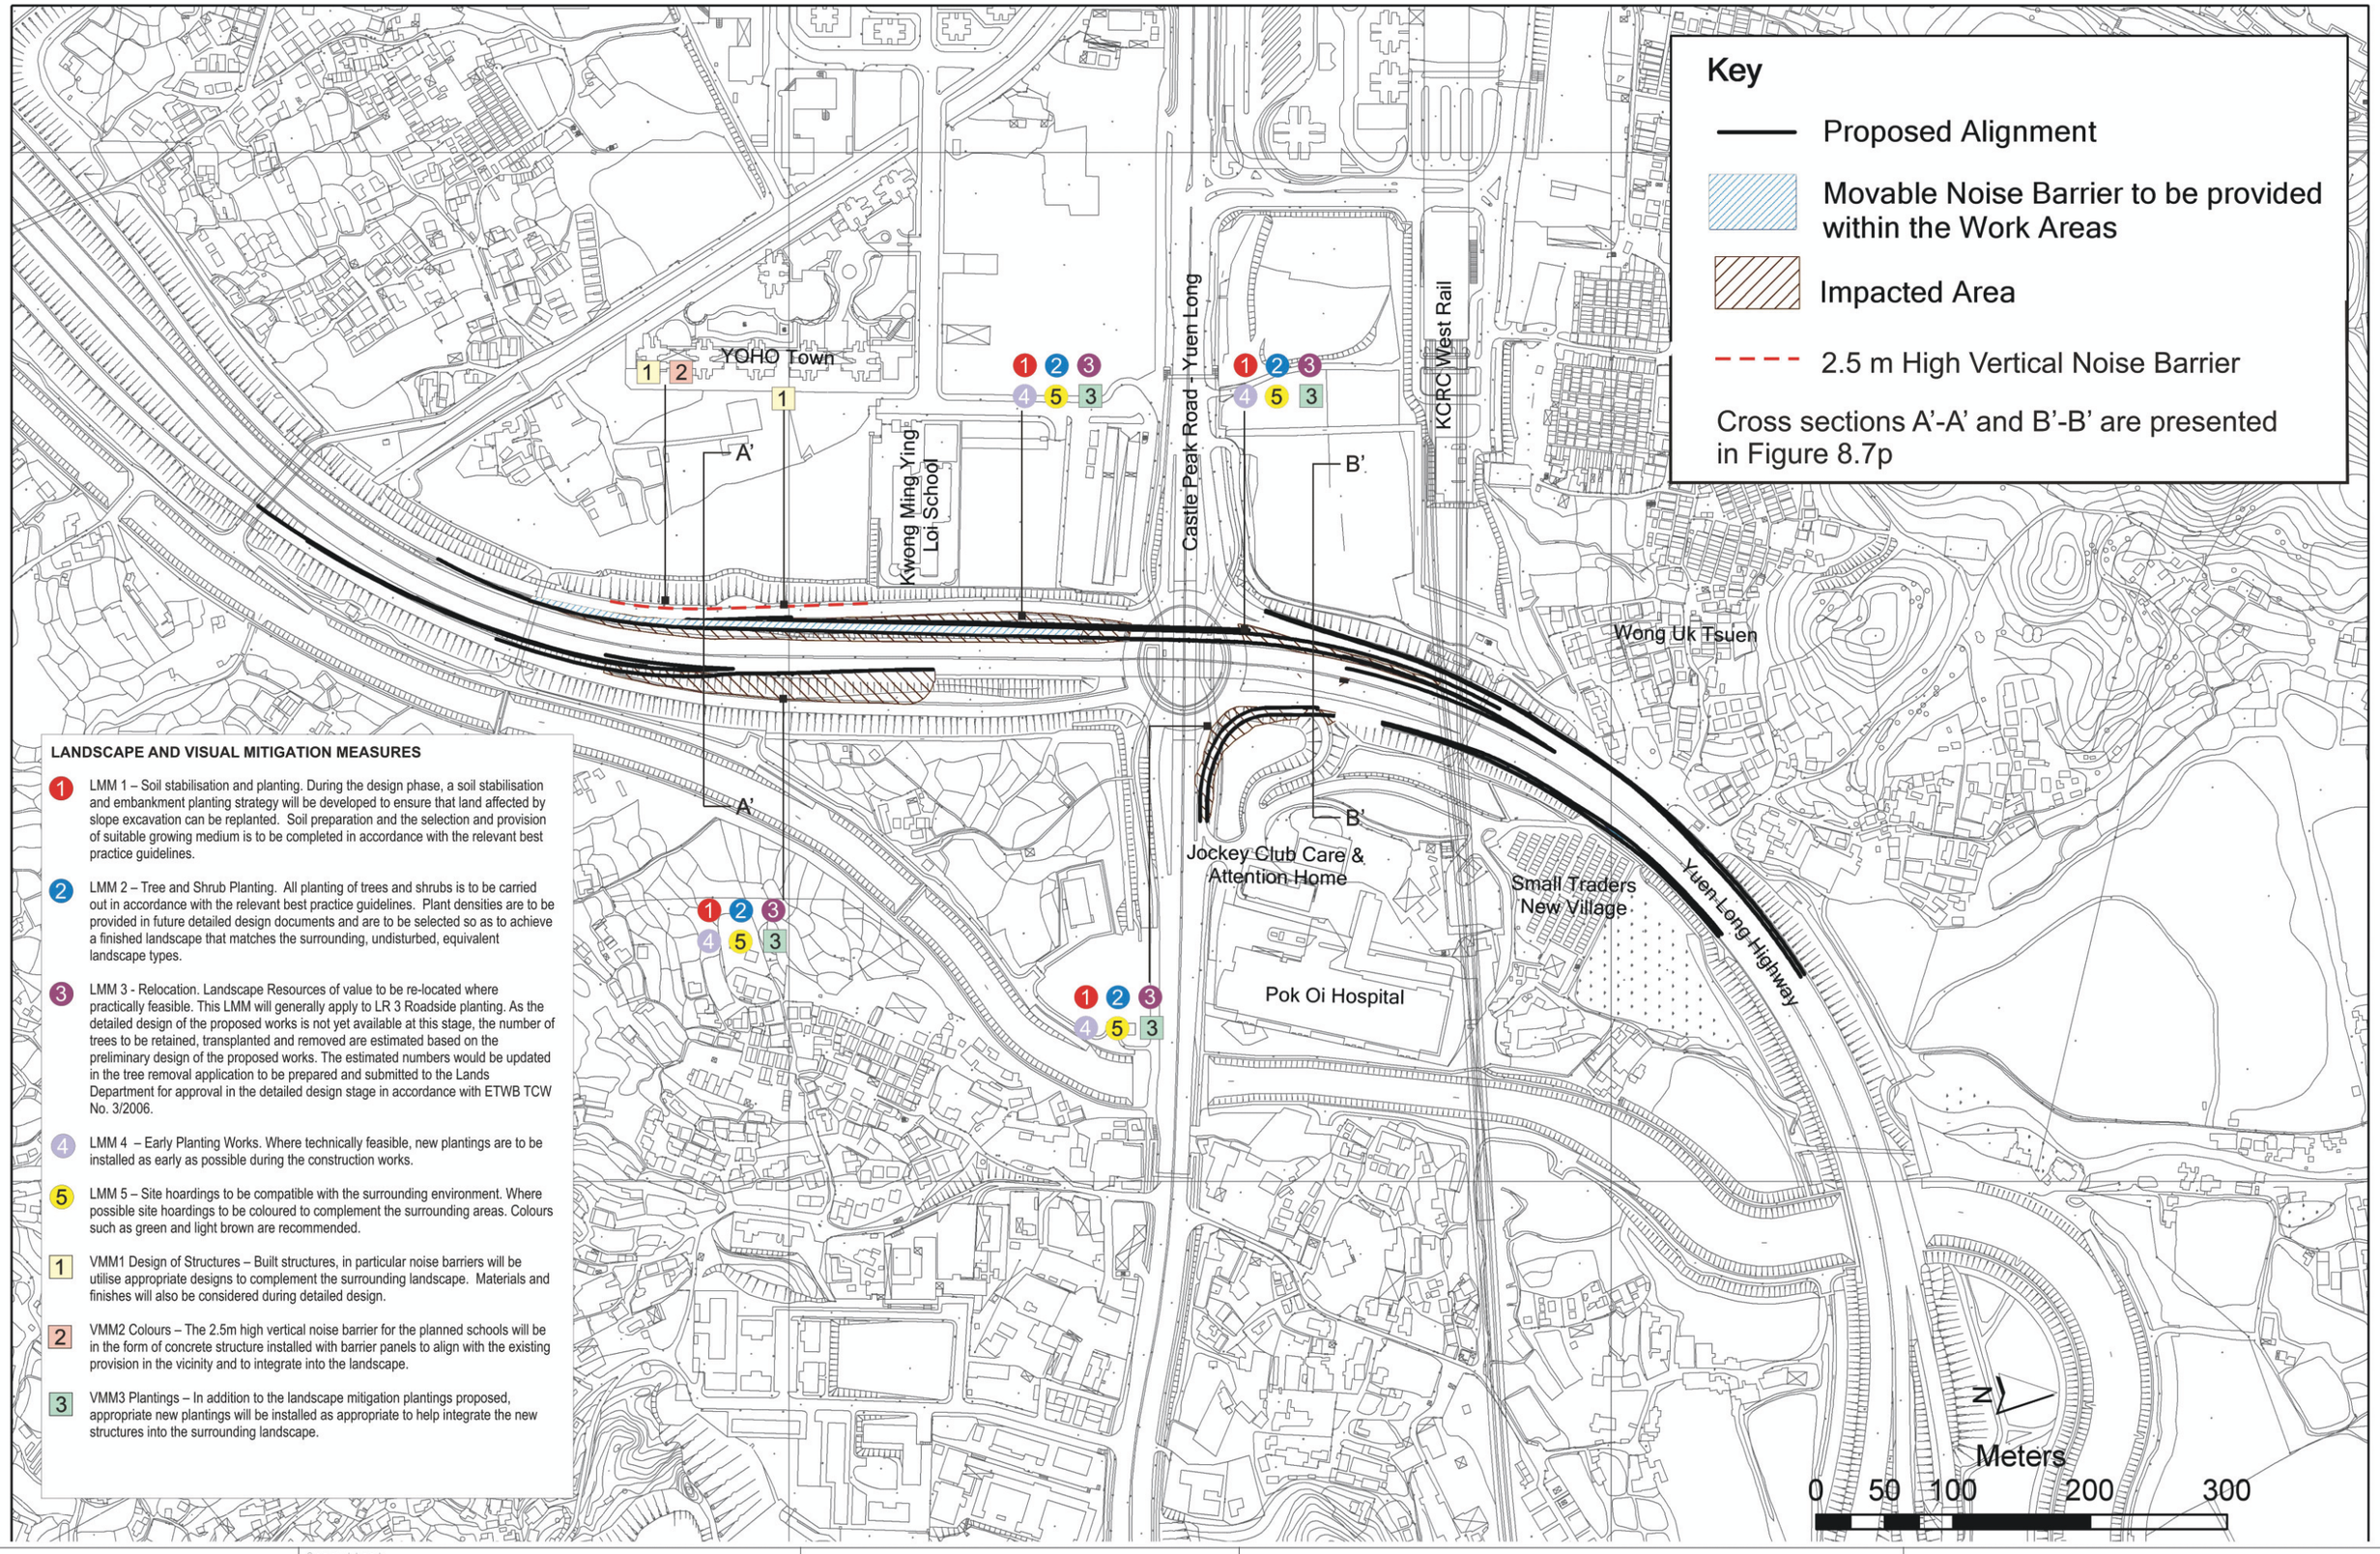
LMM 2 – Tree and Shrub Planting. All planting of trees and shrubs is to be carried out in accordance with the relevant best practice guidelines. Plant densities are to be provided in future detailed design documents and are to be selected so as to achieve a finished landscape that matches the surrounding, undisturbed, equivalent landscape types. The proposed sizes for trees and shrubs are heavy standard and whip, respectively.

LMM 3- Relocation. Landscape Resources of value to be re-located where practically feasible. This LMM will generally apply to LR 3 Roadside planting. As the detailed design of the proposed works is not yet available at this stage, the number of trees to be retained, transplanted and removed are estimated based on the preliminary design of the proposed works. The estimated numbers would be updated in the tree removal application to be prepared and submitted to the Lands Department for approval in the detailed design stage in accordance with *ETWB TCW No. 3/2006*.

LMM 4 – Early Planting Works. Where technically feasible, new plantings are to be installed as early as possible during the construction works.

LMM 5 – Site hoardings to be compatible with the surrounding environment. Where possible site hoardings to be coloured to complement the surrounding areas. Colours such as green and light brown are recommended.

The landscape mitigation measures are shown in *Figure 8.7o*.



LANDSCAPE AND VISUAL MITIGATION MEASURES

1. LMM 1 – Soil stabilisation and planting. During the design phase, a soil stabilisation and embankment planting strategy will be developed to ensure that land affected by slope excavation can be replanted. Soil preparation and the selection and provision of suitable growing medium is to be completed in accordance with the relevant best practice guidelines.

2. LMM 2 – Tree and Shrub Planting. All planting of trees and shrubs is to be carried out in accordance with the relevant best practice guidelines. Plant densities are to be provided in future detailed design documents and are to be selected so as to achieve a finished landscape that matches the surrounding, undisturbed, equivalent landscape types.

3. LMM 3 - Relocation. Landscape Resources of value to be re-located where practically feasible. This LMM will generally apply to LR 3 Roadside planting. As the detailed design of the proposed works is not yet available at this stage, the number of trees to be retained, transplanted and removed are estimated based on the preliminary design of the proposed works. The estimated numbers would be updated in the tree removal application to be prepared and submitted to the Lands Department for approval in the detailed design stage in accordance with ETWB TCW No. 3/2006.

4. LMM 4 – Early Planting Works. Where technically feasible, new plantings are to be installed as early as possible during the construction works.

5. LMM 5 – Site hoardings to be compatible with the surrounding environment. Where possible site hoardings to be coloured to complement the surrounding areas. Colours such as green and light brown are recommended.

1. VMM1 Design of Structures – Built structures, in particular noise barriers will be utilise appropriate designs to complement the surrounding landscape. Materials and finishes will also be considered during detailed design.

2. VMM2 Colours – The 2.5m high vertical noise barrier for the planned schools will be in the form of concrete structure installed with barrier panels to align with the existing provision in the vicinity and to integrate into the landscape.

3. VMM3 Plantings – In addition to the landscape mitigation plantings proposed, appropriate new plantings will be installed as appropriate to help integrate the new structures into the surrounding landscape.

8.7.12 Effectiveness of Landscape Character Areas and Landscape Resource Mitigation Measures

The mitigation measures proposed will effectively further reduce the impacts identified.

8.7.13 Summary of Residual Impacts on the Landscape Character Areas During Construction

There will be no residual construction impacts on any of the LCAs.

8.7.14 Summary of Residual Impacts on Landscape Character Areas During Operation

There will be no residual operation impacts on any of the LCAs.

8.7.15 Summary of Residual Impacts on the Landscape Resources During Construction

There will be no residual construction impacts on any of the LRs with the exception of LR3 Roadside Plantation which may have a *moderate adverse* residual construction impact.

8.7.16 Summary of Residual Impacts on Landscape Resources during Operation

There will be no residual operation impacts on any of the LRs with the exception of LR3 Roadside Plantation which may have a *slight adverse* residual construction impact.

8.8 VISUAL IMPACT ASSESSMENT

8.8.1 Introduction

The following tasks were undertaken in the visual impact assessment.

Define the viewshed that would be potentially impacted by the Project and map the areas of visual impact - This task describes the viewshed of the Project. Geographical Information System (GIS) software was utilised to determine areas that could potentially see the Project. This GIS viewshed analysis was based solely on topography and did not take into account the screening potential of vegetation, which would further reduce the actual viewshed. The GIS viewshed analysis also mapped the visibility of the Project from roads and houses.

Assess indicative viewpoints as a means of assessing the visual impact on the broader landscape - This task describes a number of Visually Sensitive Receiver (VSR) viewpoints around the Project, which have been selected as indicative of the range of views from accessible locations within the viewshed. Photomontages have been prepared to show the existing landscape and the landscape with the Project at the key VSRs.

Discuss visual mitigation measures - This task examines measures (if required) that will reduce any potential visual impacts. This may include planting and recommendations for material and finishes. These measures will also help improve the overall amenity of the Project. Residual impacts are also discussed.

8.8.2 Viewshed Determination and Areas of Potential Visual Impact

The baseline for a visual impact assessment is an understanding of the existing visual qualities within the region that can be visually affected by a development. This area is referred to as the viewshed.

Defining an appropriate viewshed is the starting point to understanding the visual impacts of a development as the area of the viewshed will vary depending on the nature and scale of the proposed development. The larger a development the greater the viewshed as it may be visually apparent for a greater distance. Once the viewshed is established, locations can be identified within the viewshed that are either particularly sensitive or indicative of the visual impact for a number of locations. In some circumstances, viewpoints may be identified beyond the viewshed to recognise the visual impact on locations of particularly high sensitivity.

The proposed noise barriers are the major visual element of the Project and may visually impact on the surrounding landscape. As the viewer moves

further away from these structures the visual impact decreases until it is no longer visible. However, before the point of non-visibility is reached, the noise barriers have reduced in scale such that they no longer has a significant visual impact on the landscape. In most landscapes, especially those which have some degree of human intervention, the limit of the viewshed is defined as that point at which the noise barriers would have an insignificant effect on the view.

8.8.3 Areas of Potential Visual Impact

A GIS viewshed analysis can determine those areas that can potentially be visually impacted by the Project. Such analysis is based on topography only, and shows those areas that would be screened by intervening hills etc. It does not account intervening vegetation or buildings, nor does it take into account small variations in topography, such as road cuttings. Therefore it is a conservative assessment of those areas that may be potentially able to view the structures of the Project. In addition it should also be noted that in the areas shown as 'not visible' this is based on visible on ground level. It does not take into account the potential visibility from on top of structures.

In addition to the GIS assessment undertaken, several detailed site inspections have been undertaken to confirm those areas that can potentially see the project and may therefore experience a visual impact.

Figure 8.8a shows the areas that can potentially view the Project.

8.8.4 Baseline Visual Character

The general baseline visual character of the development site is dominated by the existing Pok Oi interchange and the surrounding high rise residential developments at Yoho Town and Sun Yuen Long Centre. The distant vegetated hills to the east form a backdrop to the site.

8.8.5 Visually Sensitive Receivers

To determine the likely VSRs, a desktop assessment and detailed site assessment were carried out. The most sensitive VSRs were then identified and to encompass the likely range of potentially affected VSRs (*Figure 8.8b*).

8.8.6 VSR Assessment

The following factors have been considered in the visual impact assessment.

VSR Sensitivity

The first set of criteria relate to the sensitivity of the VSRs. They include:

- Value and quality of existing views;
- Availability and amenity of alternative views;

VSR 1 Sun Yuen Long Centre

VSR 1 Yoho Town

VSR 5 Ying Lung Wai

VSR 5 Tsoi Uk Tsuen

VSR 5 Tai Wai Tsuen

VSR 3 Kwong Ming Ying Loi School

VSR 6 Road Users of Pok Oi Interchange

VSR 5 Wong Uk Tsuen

VSR 2 Pok Oi Hospital

VSR 4 Yeung Uk Tsuen Village

Environmental Impact Assessment Report

Visually Sensitive Receiver Locations

Figure 8.8b

Checked	Scale	Rev.
PA		
Designed	Drawn	Date
SL	AM	07/01/2008

- Type and estimated number of receiver population;
- Viewer numbers;
- Duration of frequency of view; and
- Degree of visibility.

The views available to the identified VSRs were rated in accordance with their sensitivity to change using high, medium or low and are defined as follows:

- High

i. The nature of the viewer groups who expect a high degree of control over their immediate environment; and

- Medium

ii. The nature of the viewer groups who have some degree of control over their immediate environment.

- Low

iii. The nature of the viewer groups does not expect a high degree of control over their immediate environment.

It should be noted that the above provided are a guide only, and each VSR regardless of type is assessed according to its specific circumstances.

8.8.7 Magnitude of Change

This set of criteria is related to the specific details of the proposal and how it relates to the existing landscape and the visible magnitude of change it will cause. The criteria to be assessed are:

- Compatibility of the Project with the surrounding landscape;
- Reversibility of change;
- Scale of development;
- Viewing distance;
- Potential blockage of view; and
- Duration of impact under construction and operation phases.

The magnitude of change to a view was rated as large, intermediate, small or negligible and are defined as follows:

- Large: eg major change in view;
- Intermediate: eg moderate change in view;
- Small: eg minor change in view, and;

- Negligible: eg no discernible change in view.

The degree of visual impact or significance threshold was rated in a similar fashion to the landscape impact, ie significant, moderate, slight and negligible. Therefore, the visual impact is a product of the magnitude of change to the existing baseline conditions, the landscape context and the sensitivities of VSRs. The significance threshold of visual impact was rated for the construction phase and for Day 1 and Year 10 of the operation phase.

8.8.8 Visual Impact Assessment from Visually Sensitive Receivers (VSR)

Figure 8.8b shows the indicative viewpoints from publicly accessible locations, which have been selected for analysis. The viewpoints have been selected to represent the range of views from accessible locations.

VSR1 – View from Sun Yuen Long Centre and Yoho Town.

This VSR is located at about 400 metres west of the Project. Sun Yuen Long Centre is a residential complex and therefore the VSR will have a high sensitivity. The three phases of Yoho Town are located to the south of Sun Yuen Long Centre, and are at about 170 metres west of the Project.

Figure 8.8c shows that the changes to Pok Oi interchange will be visible to a small extent.

Table 8.8a Sensitivity / Quality

Items	Sensitivity / Quality
Value and quality of view	Moderate
Number of VSR	Many
Availability and amenity of alternative views	High
Duration and frequency of views to development	Medium
Degree of visibility of Development	Medium
Sensitivity/Quality of VSR	High

Table 8.8b Magnitude of Change

Items	Construction	Operation
Compatibility with surrounding landscape	Moderate	High

	Small	Slight impact	Slight / Moderate impact	Moderate impact	**Adverse**
	Negligible	Negligible impact	Negligible impact	Negligible impact	

According the Significance Threshold matrices presented above, there will be *Slight* impact during construction and operation. However given the highly compatible nature of the Project with the existing visual character, the impact is considered to be *Slight Adverse*.

VSR3 – View from Kwong Ming Ying Loi School

This VSR is located approximately 25 metres from the Project at the closest point. The school comprises students, teachers and associated staff and for the purposes of this assessment are classified as worker VSRs

Figure 8.8e shows that the changes to Pok Oi interchange will be visible for this VSR.

Table 8.8i Sensitivity / Quality

Items	Sensitivity / Quality
Value and quality of view	Medium
Number of VSR	Medium
Availability and amenity of alternative views	Medium
Duration and frequency of views to development	Medium
Degree of visibility of Development	Low

		Sensitivity / Quality			Beneficial
		Low	**Medium**	**High**	
Magnitude of Change	**Large**	Moderate Impact	Moderate / significant impact	Significant impact	**Neither beneficial nor adverse**
	Intermediate	Slight / Moderate impact	Moderate Impact	Moderate/ significant impact	
	Small	Slight impact	Slight / Moderate impact	Moderate impact	**Adverse**
	Negligible	Negligible impact	Negligible impact	Negligible impact	

Table 8.8l Significance Threshold during Operation

		Sensitivity / Quality			Beneficial
		Low	**Medium**	**High**	
Magnitude of Change	**Large**	Moderate Impact	Moderate /significant impact	Significant impact	**Neither beneficial nor adverse**
	Intermediate	Slight / Moderate impact	Moderate Impact	Moderate/ significant impact	
	Small	Slight impact	Slight / Moderate impact	Moderate impact	**Adverse**
	Negligible	Negligible impact	Negligible impact	Negligible impact	

According the Significance Threshold matrices presented above, there will be *Slight* impact during construction and operation. However given the highly compatible nature of the Project with the existing visual character, the impact is considered to be *Slight Adverse.*

A noise barrier is proposed along the edge of the off ramp adjacent to the planned school as shown on *Annex C11-2.* As this section of barrier was proposed to protect the planned schools, it is only required to be constructed before the occupation of the planned schools. The existing vegetation almost completely screens the view to the proposed noise barrier as can be seen.

VSR4 – View from Yeung Uk Tsuen Village

These VSR's are located approximately 300 metres from the Project. The village is at a lower level than the Project and there is extensive vegetation screening the Project.

Figure 8.8f shows that the changes to Pok Oi interchange will not be visible.

	Intermediate	Slight / Moderate impact	Moderate Impact	Moderate/ significant impact	
	Small	Slight impact	Slight / Moderate impact	Moderate impact	**Adverse**
	Negligible	Negligible impact	Negligible impact	Negligible impact	

Due to the extensive screening vegetation between this VSR and the existing site, the Project will not be visible for this VSR, resulting in a *Negligible* impact.

VSR 5 Views from Villages at the Northwest of the Site.

The villages include Wong Uk Tsuen, Tai Wai Tsuen, Ying Lung Wai, Tsoi Uk Tsuen and they are clustered to the north-east of the site. They are residential VSRs, and they are generally located at a lower lever than the Pok Oi Interchange. The Project is also screened by existing roadside vegetation. They are 200-300m from the site. It is possible that parts of the Project will be visible from within these village areas.

Table 8.8q Sensitivity / Quality

Items	Sensitivity / Quality
Value and quality of view	Medium
Number of VSR	Many
Availability and amenity of alternative views	Medium
Duration and frequency of views to development	Medium
Degree of visibility of Development	Small

	Intermediate	Slight / Moderate impact	Moderate Impact	Moderate/ significant impact	
	Small	Slight impact	Slight / Moderate impact	Moderate impact	**Adverse**
	Negligible	Negligible impact	Negligible impact	Negligible impact	

As these VSR's are residential they have a high sensitivity to change. As it is possible some areas of the development will be visible, the magnitude of change is considered to be small. This will result in a *Moderate Adverse* Significance Threshold during both construction and operation.

VSR 6 Views for Road Users of Pok Oi Interchange

The users for the altered Pok Oi Interchange will be road users. The road users will have views to the alterations from vary distances, but the closest will be approximately 10m.

Table 8.8u Sensitivity / Quality

Items	Sensitivity / Quality
Value and quality of view	Low
Number of VSR	Many
Availability and amenity of alternative views	Low
Duration and frequency of views to development	Medium
Degree of visibility of Development	High

Magnitude of change	Small	Small

Table 8.8w Significance Threshold during Construction

		Sensitivity / Quality			Beneficial
		Low	Medium	High	
Magnitude of Change	Large	Moderate Impact	Moderate / significant impact	Significant impact	Neither beneficial nor adverse
	Intermediate	Slight /Moderate impact	Moderate Impact	Moderate/ significant impact	
	Small	Slight impact	Slight /Moderate impact	Moderate impact	Adverse
	Negligible	Negligible impact	Negligible impact	Negligible impact	

Table 8.8x Significance Threshold during Operation

		Sensitivity / Quality			Beneficial
		Low	Medium	High	
Magnitude of Change	Large	Moderate Impact	Moderate / significant impact	Significant impact	Neither beneficial nor adverse
	Intermediate	Slight / Moderate impact	Moderate Impact	Moderate/ significant impact	
	Small	Slight impact	Slight / Moderate impact	Moderate impact	Adverse
	Negligible	Negligible impact	Negligible impact	Negligible impact	

The road users are considered to have a low sensitivity to change as the existing quality of the view is low. The development will be visible, but only for a short duration which will result in a significance threshold that is *Slight* and *Neither Beneficial nor Adverse.*

8.8.9 Visual Mitigation Measures

Whilst the impacts identified in the section above range from Slight to Negligible, some Visual Mitigation Measures are proposed to not only reduce the impacts to improve the overall appearance of the Project.

VMM1 Design of Structures Built structures, in particular noise barriers will be utilise appropriate designs to complement the surrounding landscape. Materials and finishes will also be considered during detailed design.

VMM2 Colours The 2.5m high vertical noise barrier for the planned schools will be in the form of concrete structure installed with barrier panels to align with the existing provision in the vicinity and to integrate into the landscape.

VMM3 Plantings In addition to the landscape mitigation plantings proposed, appropriate new plantings will be installed as appropriate to help integrate the new structures into the surrounding landscape.

Figure 8.7o shows the locations of these measures.

Table 8.8y Un-mitigated and Mitigated Impacts at the VSRs

VSR	Un-Mitigated Visual Impact		Recommended Mitigation	Mitigated Impacts		
	Construction	Operation		Construction	Operation Day 1	Operation Year 10
1 Sun Yuen Long Centre and Yoho Town	Moderate	Moderate	1-3	Slight	Slight	Slight
2 Pok Oi Hospital	Slight	Slight	1-3	Slight	Slight	Slight
3 Kwong Ming Ying Loi School	Slight	Slight	1-3	Slight	Slight	Slight
4 Yeung Uk Tsuen	Negligible	Negligible	Nil	Negligible	Negligible	Negligible
5 Villages at the Northwest of the Site	Moderate	Moderate	1-3	Slight	Slight	Slight
6 Road Users of Pok Oi Interchange	Slight	Slight	1-3	Slight	Slight	Slight

8.8.10 Visual Impact Summary

The unmitigated impacts identified are *Slight* for the following VSRs:

VSR 1 Sun Yuen Long Centre and Yoho Town;

VSR 2 Pok Oi Hospital;

VSR 3 Kwong Ming Ying Loi School, and;

VSR 6 Road users of Pok Oi Interchange.

Whilst Visual Mitigation Measures are proposed to reduce these impacts, a *slight adverse* residual impact will remain for these VSRs.

The unmitigated impacts are identified as moderate for VSR 1 and VSR 5 villages at the northwest of the Site, however following the implementation of the Visual Mitigation Measures, there will be a *slight adverse* residual impact.

For VSR 4, the village at Yeung Uk Tsuen, the development will not be visible and therefore the residual impact will be *negligible.*

8.9 CONCLUSIONS

Three Landscape Character Areas (LCAs) were identified, LCA1 Miscellaneous Rural Fringe Landscape, LCA2 Miscellaneous Urban Fringe Landscape, and LCA3 Urban Peripheral Village Landscapes. The residual impacts on all three LCAs will be *negligible.*

A total of seven Landscape Resources (LRs) were identified, LR1 Roads, LR2 Agricultural Land, LR3 Roadside Plantation, LR4 Developed Area, LR5 Disturbed Area, LR6 Nullah and LR7 Village. LR3 Roadside Vegetation will experience *moderate adverse* and *slight adverse* residual impacts during construction and operation respectively. However, there will be *negligible* residual impacts on all other Landscape Resources.

Six Visually Sensitive Receivers were identified, and five of the six will experience *slight adverse* residual impacts, and one will experience *negligible* residual impacts.

According to *Annex 10* of the *EIAO-TM* the Landscape and Visual Impacts are considered *acceptable with mitigation*.

The major sensitive areas within the Study Area include residential premises, wholesale market, hospital, home for the aged and educational institutions. With the implementation of the proposed mitigation measures, no adverse environmental impacts are expected at the air, noise and water quality sensitive receivers within the Study Area during the construction and operational phases of the Project. A summary of the key environmental outcomes of the EIA Study and benefits of the environmental protection measures recommended are presented in *Table 9.1a*.

Table 9.1a Summary of Key Environmental Outcomes/Benefits

Issue	Environmental Outcomes/Benefits
The Project	**Requirements:** • Construction of the 140m long single lane flyover with 410m and 100m long slip roads connecting from ground level to flyover and from flyover back to ground level, respectively. • Construction of the 280m long slip road connecting the southbound carriage of POF to the southbound carriageway of the ground level section of YLH on the southern arm of POR. • Resurfacing and re-marking of two stretches of southbound and northbound carriageways of the ground level section of YLH on the northern arm of POR. • Construction of the 110m long segregated left-turn lane at the northern arm of POR. • Construction of associated earth retaining structures, slope works and works on environmental mitigation, landscape, drainage, road lightings, water mains and traffic aids. **Benefits:** • The Project can relieve the traffic pressure and traffic queues on the existing POR. **Potential consequences without the Project:** • Without the Project, the northern and southern approaches of POR will further deteriorate and the tailback of traffic on the southbound carriageway of the northern approach may block the through traffic from Tai Lam Tunnel / NT North to Tuen Mun / Tin Shui Wai / Hong Kong – Shenzhen Western Corridor. Long queues would be anticipated at both ends of Interchange and as a result of severely congested in POR. • With traffic congestion at both ends of POR, there would be consequential adverse air quality impacts to the nearby ASRs as the vehicles are in idling condition in traffic congestion.

Issue	Environmental Outcomes/Benefits
Construction Noise Impact	*Impact/Problem:* • Unmitigated cumulative construction noise level is up to 82 dB(A). *Environmental benefits of environmental protection measures recommended & Environmentally sensitive areas protected:* • Recommended mitigation measures: adopting quiet construction plant, movable noise barriers and scheduling of PMEs/construction activities; and implementing good site practices. • For the mitigated scenario, the predicted noise levels at all representative NSRs comply with the daytime construction noise standard as set out in the *EIAO-TM*.
Road Traffic Noise Impact	*Impact/Problem:* • The traffic noise levels with and without the Project at the design year are not increased by 1.0 dB(A). • No adverse traffic noise impacts are anticipated at the existing and future ASRs with the provision of 2.5m high vertical noise barrier for the planned school.
Construction Air Quality Impact	*Impact/Problem:* • Potential dust nuisance. *Environmental benefits of environmental protection measures recommended:* • Mitigation measures: implement the *Air Pollution Control (Construction Dust) Regulation* and good site practices. • No adverse air quality impacts are anticipated.
Operational Air Quality Impact	*Impact/Problem:* No adverse traffic emission impacts are anticipated at the existing and future ASRs.
Construction Water Quality Impact	*Impact/Problem:* • General construction activities associated with the construction of the Project could lead to site runoff. *Environmental benefits of environmental protection measures recommended:* • All of the recommended mitigation measures are implemented and all construction site / work area discharges comply with the *TM-DSS* standards. • No unacceptable residual water quality impacts are expected during the construction of the Project.
Operational Water Quality Impact	*Impact/Problem:* • Adverse water quality impacts associated with the operation of the Project are not expected at the water sensitive receivers within the Study Area. Therefore, there will be no residual impact associated with the operation of the Project.

Issue	Environmental Outcomes/Benefits
Waste Management Implications	*Impact/Problem:* • Wastes generated by construction activities: general refuse from the workforce, chemical waste from plant and equipment maintenance, and C&D material from excavation works and the demolition of existing structures. *Environmentally friendly designs recommended:* • C&D material with suitable characteristics should be reused on-site as far as practicable. Surplus material would require disposal to a public fill reception facility. *Environmental benefits of environmental protection measures recommended:* • With the implementation of the recommended mitigation measures and practices for the handling, transportation and disposal of the identified waste arisings, no adverse environmental impacts are expected.
Landscape and Visual Impact	*Impact/Problem:* • Three Landscape Character Areas (LCAs) , LCA1 Miscellaneous Rural Fringe Landscape, LCA2 Miscellaneous Urban Fringe Landscape, and LCA3 Urban Peripheral Village Landscapes, were identified. The residual impacts on all three LCAs will be negligible. • A total of seven Landscape Resources (LRs) , LR1 Roads, LR2 Agricultural Land, LR3 Roadside Plantation, LR4 Developed Area, LR5 Disturbed Area, LR6 Nullah and LR7 Village, were identified. LR3 Roadside Plantation will experience moderate adverse and slight adverse residual impacts during construction and operation respectively. However, there will be negligible residual impacts on all other Landscape Resources. • Four Visually Sensitive Receivers (VSRs) , VSR1 Sun Yuen Long Centre, VSR2 Pok Oi Hospital, VSR3 Kwong Ming Ying Loi School and VSR4 Yeung Uk Tsuen, were identified. There will be negligible residual impacts (impact at year 10) on all four VSRs.

10 ENVIRONMENTAL MONITORING AND AUDIT

10.1 INTRODUCTION

This *Section* presents the EM&A requirements for the construction and operation of the Project, based on the assessment results for the various environmental issues considered.

The objectives of undertaking EM&A for the Project are as follows:

- to provide a database against which any short- or long-term environmental impacts of the Project can be determined;
- to provide an early indication should any of the environmental control measures or practices fail to achieve the acceptable standards;
- to monitor the performance of the Project and the effectiveness of mitigation measures;
- to verify the environmental impacts predicted in this EIA;
- to determine project compliance with regulatory requirements, standards and government policies;
- to take remedial action if unexpected problems or unacceptable impacts arise; and
- to provide data to enable an environmental audit.

The following sections discuss the recommended EM&A requirements. A separate EM&A Manual has been prepared for the Project to provide details of the EM&A programme and procedures.

10.2 AIR QUALITY

10.2.1 Construction Phase

With the implementation of the proposed dust suppression measures stipulated in the *Air Pollution Control (Construction Dust) Regulation*, good site practices and comprehensive dust monitoring and audit, the dust impact would be further diminished.

Regular site auditing is recommended to ensure the efficacy of the control measures.

10.2.2 Operational Phase

There will be no exceedance of AQOs at the sensitive receivers. No mitigation measures or environmental monitoring are considered necessary during the operational phase of the Project.

10.3 NOISE

10.3.1 Construction Phase

Construction noise impacts from the Project are expected at the representative NSRs. Appropriate mitigation measures such as the adoption of quiet PMEs, movable noise barrier and scheduling of PMEs/construction activities are required to alleviate the impacts to a level that meets the *EIAO-TM* criteria. Noise monitoring during the construction phase of the Project is recommended to ensure that the relevant criteria are not exceeded and that the recommended mitigation measures are implemented properly. The recommended noise monitoring locations are indicated in *Table 10.3a*.

Table 10.3a Noise Monitoring Stations for Construction Phase

Monitoring Station	Description
KMYLS1	Kwong Ming Ying Loi School
JCCAH1	Jockey Club Care & Attention Home

The status and location of NSRs may change in time and the location of the noise monitoring stations may need to be adjusted accordingly. In the event of such changes, the monitoring location should be updated for agreement with EPD.

When alternative monitoring location is proposed, the following criteria should be followed as far as practicable:

- close to the major site activities which are likely to have noise impacts; and
- close to the NSRs.

The monitoring station should normally be at a point 1 m from the exterior of the NSR building façade and at a height of approximately 1.2 m above ground or at the height that has the least obstructed view of the construction activities in relation to the NSR. If access to the normal monitoring position cannot be obtained, an alternative position should be chosen and a correction to the measurements should be made, if appropriate. For instance, a correction of +3 dB(A) should be made to free field measurements. Once the positions for the monitoring stations are chosen, the baseline monitoring and the impact monitoring should be carried out at the same positions.

10.3.2 Operational Phase

Upon the commissioning of the Project, traffic noise monitoring should be carried out at the NSRs in the vicinity of the Project for one year. The purpose of the monitoring is to confirm results of the traffic noise impact assessment and to ensure that compliance with the relevant noise criteria is achieved.

A monitoring plan should be prepared and agreed with EPD at least 6 months before the operation of the works under the Project for the purpose of assessing the accuracy of traffic noise predictions by comparing the noise impact predictions with the actual impacts. The monitoring plan should provide information on monitoring locations, monitoring schedules, methodology of noise monitoring including noise measurement procedures, traffic counts and speed checks, and methodology of comparison with the predicted levels. Monitoring details and results including the comparison between the measured noise levels and the predicted levels should be recorded in a report to be deposited with EPD within one month of the completion of the monitoring.

The traffic noise levels should be measured twice at 6-month intervals within the first year upon completion of the Project. Measurements should be made in terms of the A-weighted L_{10} over 3 half hour periods during the peak traffic hour; other parameter including L_{eq} should also be taken for reference.

The two monitoring stations selected for operational traffic noise monitoring are indicated in *Table 10.3b*.

Table 10.3b Traffic Noise Monitoring Stations for Operational Phase

Monitoring Station	Description
KMYLS1	Kwong Ming Ying Loi School
JCCAH1	Jockey Club Care & Attention Home

In choosing the specific monitoring locations, the following criteria should be observed:

- they should be located at NSRs in the vicinity of the recommended direct technical remedies;
- one high floor and one medium floor monitoring points should be chosen at each location as far as practicable; and
- the selected monitoring locations should allow monitoring to be done twice within one year after implementation of the mitigation measures during operation of the Project.

Similar to the case for the construction phase monitoring, the status and locations of NSRs may change in time and the monitoring locations may need to be adjusted accordingly. In such event, agreement should be obtained from EPD for alternative monitoring locations.

The operational noise monitoring should be carried out at a distance of 1 m from the openable window and 1.2 m above the floor level of the NSRs identified. Any necessary corrections to be adopted should be agreed with EPD before the commencement of the monitoring programme. Specific measurements to be obtained include:

- one set of measurements during the morning traffic peak hour on a normal weekday;
- one set of measurements during the evening traffic peak hour on a normal weekday;
- a concurrent census of traffic flow and percentage heavy vehicles conducted for the far-side and near-side of the road and the existing road network in the vicinity of each measurement point;
- average vehicle speed estimated for far-side and near-side of the road and the existing road network in the vicinity of each measuring point.

The measured/ monitored noise levels should be compared with the predicted results and the predicted traffic flow conditions (calculated noise levels based on concurrent traffic census obtained). Where discrepancies are observed, an attempt should be made to identify the cause of such discrepancies.

10.4 WATER QUALITY

10.4.1 Construction Phase

The water quality assessment has concluded that the identified water quality impacts could be minimised by implementing the recommended mitigation measures for the construction works, such as control measures on runoff and drainage from the Site to minimise construction run-off and proper site management and good housekeeping practices. No unacceptable residual water quality impact is expected. Any effluent discharges from the Site will be required to comply with the terms and conditions of a discharge licence issued by EPD under the *WPCO*.

It is recommended that regular site inspections be undertaken to inspect the construction activities and works areas to ensure that the recommended mitigation measures are properly implemented.

10.4.2 Operational Phase

No residual impact is anticipated during the operational stage of the Project, EM&A requirement is considered not necessary.

10.5 WASTE MANAGEMENT

The Contractor will be responsible to ensure that all wastes produced during the construction of the Project are handled, stored, reused and disposed of in accordance with the recommended good waste management practices and EPD's regulations and requirements. The mitigation measures recommended in *Section 7* should form the basis of the Construction Waste Management Plan to be developed by the Contractor before the commencement of the construction.

It is recommended that the waste arisings generated by the construction activities should be audited periodically to determine if wastes are being managed in accordance with approved procedures and the Construction Waste Management Plan. Routine site audits should look at all aspects of waste management including waste generation, storage, reuse, transport and disposal and should check the implementation of the recommended good site practices and other waste management mitigation measures.

10.6 LANDSCAPE AND VISUAL

The EIA has recommended landscape and visual mitigation measures to be implemented during construction and operation phases of the Project. EM&A is required to ensure that the proposed mitigation measures are effectively implemented.

Baseline monitoring is required to record baseline conditions of the Site, in particular, changes of each landscape resource, landscape character area and the view conditions of each visually sensitive receiver. Parameters used to describe changes in each of the above should be the same as in *Section 8* of this report. The baseline monitoring should be conducted as a one-off site survey prior to the commencement of any construction works.

During the construction phase, all mitigation measures proposed in the EIA should be implemented by the Contractor and audited by a landscape auditor of the Environment Team, on a regular basis to ensure compliance with the intended aims of the measures. Site inspections should be undertaken at least once every two weeks throughout the construction period.

The landscape auditor should also audit the operational phase mitigation measures proposed in *Section 8* and as depicted in the landscape mitigation plan to ensure that they are fully implemented during the Project design and construction stages.

11 CONCLUSIONS

11.1 INTRODUCTION

This *Section* presents the conclusions of the assessments undertaken for of the potential environment impacts associated with the construction and operation of the Project.

11.2 NOISE IMPACT

This assessment has predicted the construction noise impacts of the Project during normal daytime working hours. With the use of quiet PME, movable noise barriers and scheduling of PMEs/construction activities, the predicted construction noise levels arising from the Project at all representative NSRs will comply with the *EIAO-TM* construction noise criteria.

A construction noise EM&A programme is recommended to check the compliance with the noise criteria.

The potential road traffic noise impacts have been assessed based on the worst year traffic forecast for Year 2026. With the provision of a 2.5m high vertical noise barrier for the planned school, no adverse noise impacts are predicted at the NSRs during the operational phase of the Project as a result of the limited traffic flow at the road sections within the meaning of Item A.1 of Schedule 2 under the *EIAO*. The traffic noise impact is considered insignificant as the traffic noise level with the Project is not greater than that without the Project at the design year by 1.0dB(A) and the mitigated noise levels due to the road sections within the meaning of Item A.1 of Schedule 2 under the *EIAO* complied with the noise criteria as stipulated in the *EIAO-TM*.

Monitoring of road traffic noise is recommended to confirm the results of the traffic noise impact assessment during the first year after the operation of the Project.

11.3 AIR QUALITY IMPACT

In view of limited scale of construction area, adverse dust impact at the ASRs is not expected from the Project. Appropriate dust control and suppression measures as stipulated in the *Air Pollution Control (Construction Dust) Regulation* will be implemented to minimize any potential dust impact.

During operation, the vehicular emission sources within the Study Area are dominated by road traffic on the proposed new road sections and the existing road network including POR, Castle Peak Road and YLH. An assessment was conducted to predict the vehicle emissions from open road networks and the implementation of noise barriers and the proposed planters and concrete

parapet wall for the flyover. No mitigation measures are required as no exceedances of the relevant air quality criteria are predicted.

11.4 WATER QUALITY IMPACTS

Water quality impacts due to land-based construction, including road works, minor slope modification works and construction of noise barriers, are mainly associated with the surface runoff, effluent discharge from the site, and sewage from on-site construction workers. Impacts can be controlled to comply with *WPCO-TM* standards by implementing the recommended mitigation measures. No unacceptable residual impacts on water quality are anticipated.

It is considered that impacts resulting from the operation of the Project, in terms of water quality, will be minimal given that the Project will be designed with adequate drainage systems.

11.5 WASTE MANAGEMENT IMPLICATIONS

Wastes generated by the construction activities are likely to include C&D material, general refuse from the workforce and chemical waste from the maintenance of construction plant and equipment. Provided that these identified waste arisings are handled, transported and disposed of using approved methods and that the recommended good site practices are strictly followed, adverse environmental impacts are not expected during the construction phase.

11.6 LANDSCAPE AND VISUAL IMPACT

Three Landscape Character Areas (LCAs) , LCA1 Miscellaneous Rural Fringe Landscape, LCA2 Miscellaneous Urban Fringe Landscape, and LCA 3 Urban Peripheral Village Landscapes, were identified. The residual impacts on all three LCAs will be negligible.

A total of seven Landscape Resources (LRs) , LR1 Roads, LR2 Agricultural Land, LR3 Roadside Plantation, LR4 Developed Area, LR5 Disturbed Area, LR6 Nullah and LR7 Village, were identified. LR3 Roadside Plantation will experience moderate adverse and slight adverse residual impacts during construction and operation respectively. However, there will be *negligible* residual impacts on all other Landscape Resources.

Four Visually Sensitive Receivers (VSRs) , VSR1 Sun Yuen Long Centre, VSR2 Pok Oi Hospital, VSR3 Kwong Ming Ying Loi School and VSR4 Yeung Uk Tsuen, were identified. There will be negligible residual impacts (impact at year 10) on all four VSRs.

According to *Annex 10* of the *EIAO-TM*, the landscape and visual impacts are considered acceptable with mitigation.

11.7 OVERALL CONCLUSION

The environmental impact assessment has concluded that no unacceptable environmental impacts are envisaged as a result of the construction and operation of the Project, provided that the recommended mitigation measures are implemented.

Annex A

Outline Implementation Programme of the Project

PWP ITEM NO. 798TH - Improvement to Pok Oi Interchange

ID	Task Name	Duration	Start	Finish

Dear Ms Ng,

Agreement No. WD 6/2007
Improvement to Pok Oi Interchange –
Environmental Impact Assessment Study
Use of Central Air-conditioning System

I refer to your fax dated 10 October 2008 (Ref/Project number 0072252_Fax Pok Oi Hospital_20081010.doc).

2. We would like to confirm that central air-conditioning system is provided for Pok Oi Hospital and that we are not relying on openable windows for ventilation.

3. Should you have any queries, please feel free to contact me at 2486 8906 or Ms Gina WAI at 2486 8913.

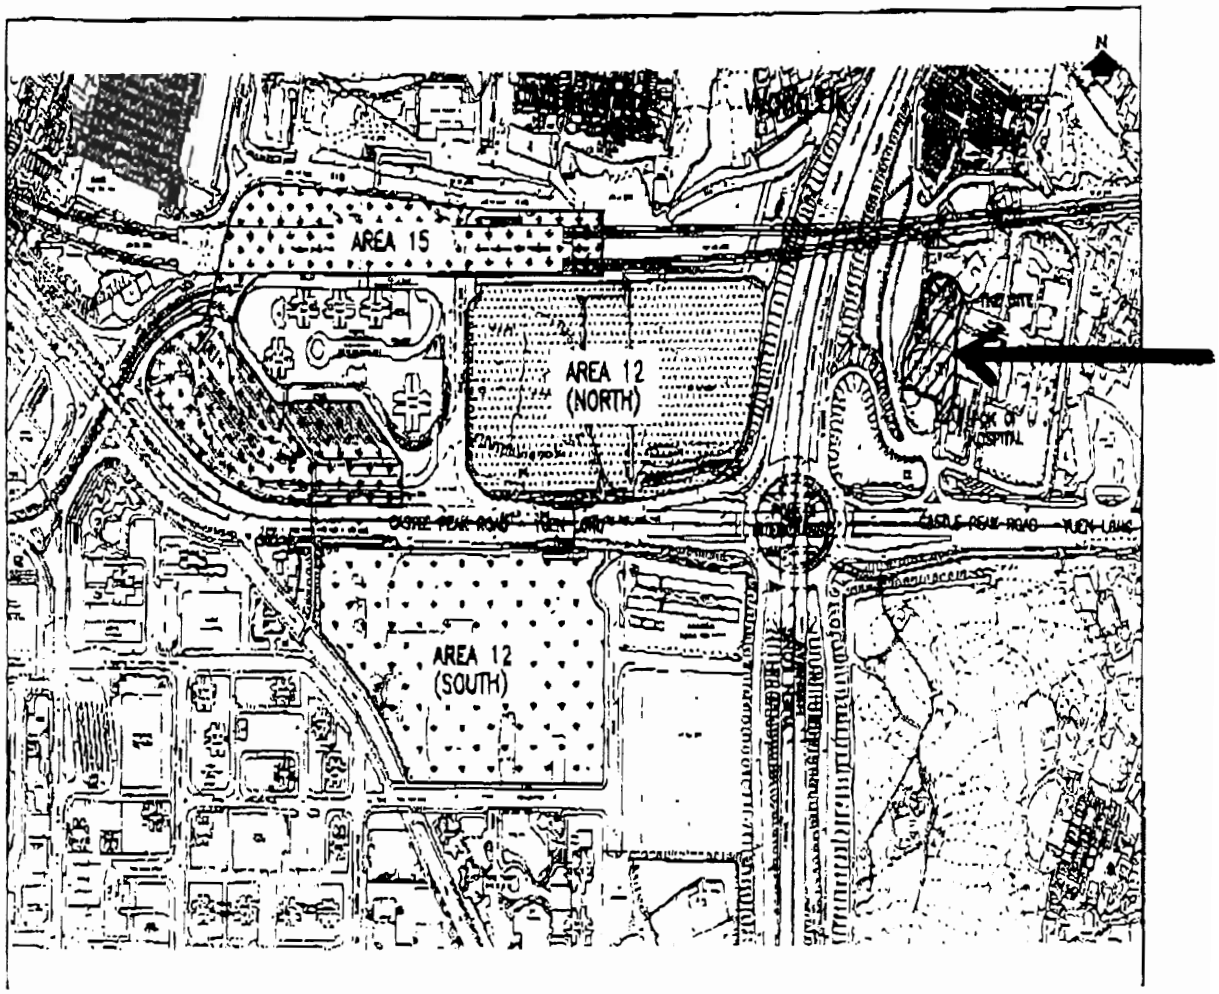
PWP Item No. 798TH
Improvement to Pok Oi Interchange
Typical Arrangement of Indoor Recreation Centre

I refer to your memo under reference.

2. Please note that the said site has not been accorded high priority for development by Yuen Long District Council and there is no development programme for the site at present. Furthermore, the sports centre in Tin Shui Wai which is now under construction and the sports centres in Area 3, Yuen Long and Area 101, Tin Shui Wai which are now under active planning will be equipped with centralised air-conditioning system and fixing glazing.

(Ms Caroline HO)
for Director of Leisure and Cultural Services

Figure 2 **Site Context**



*** Not to Scale**

Table 2 Schedule of Accommodation

	[redacted]	Previously Approved Scheme 1996	Third Scheme	Second Scheme	First Scheme
Application Site Area		3,600m²	3,660m²	3,660m²	3,168m²
Proposed Domestic Plot Ratio (excluding Pun Uk)		2.66	2.66	3.0	5
Proposed Domestic Site Coverage (excluding Pun Uk)		16.69%	16.69%	29.9%	29.7%
Proposed Total GFA		9,735.5m²	9,735.5m²	10,965m²	15,837m²
Proposed Building Height (main roof)		58.5mPD	58.5mPD	44.4mPD	63.1mPD
Proposed Number of Flats		95	95	118	187
Average Flat Size		102.5m²	102.5m²	71.4m²	84.63m²
Design Population		238 persons	295 persons	295 persons	468 persons
Proposed Number of Carparking Spaces		84	38	118	172
Proposed Number of Residential Blocks		3	3	5	4

Proposed Number of Storeys (excluding podium and basement)		12-15	12-15	10-11	7
Proposed Number of Basement Levels		2	1	1	1
Public Open Space (including Pun Uk)		1400m² Approx.	1400m² Approx.	169m² Approx.	Nil

Master Layout Plan

5.3 The Master Layout Plan is shown in Figure 5, which is essentially the same as of the previously approved scheme. The proposed development comprises a total of three residential blocks on top of 2 podium levels and 1 level of basement. The heights of these blocks vary from 12 to 15 storeys. The podium and basement levels are mainly allocated for carparking facilities (Figures 6 and 8). An area of about 190m² located to the south of Pun Uk is proposed for children's play area, landscaped open space and a buffer to Pun Uk (Figure 8). Typical floor plan and diagrammatic section of the proposal are shown on Figures 10.

5.4 To ease the technical issues of protecting the structural stability of the adjacent historical building (i.e. Pun Uk) during construction, the present scheme proposes deletion of one level of basement carpark. A total of 59 carparking spaces (i.e. 1 carparking space per 1.6 flats) is provided, in compliance with the current parking standard.

5.5 To mitigate the potential noise impact from Castle Peak Road, Yuen Long Highway and the West Rail, a "Self Protective" building design is adopted. The facades of building facing the said roads and the rail will adopt appropriate noise mitigation measures, such as the use of black facade, fixed window and non habitable window, balconies with acoustic treatment and architectural fins, and the building blocks are oriented in such a manner that all noise sensitive areas within a flat will be inward facing, i.e. towards the landscaped podium and Pok Oi Hospital.

a) Single aspect building design adopted – no openable window for habitable room on N, E and W sides. Fixed glass window adopted

b) 1.5m deep balcony at the living room of Units B & C, with blank wall to the north and 1.2m parapet wall on the other side.

c) 1m solid wall (architectural fin) for Unit G's bedroom

d) Balcony applied at living room and/or bedroom

Construction Plant Inventory (Without Mitigation)
(Construction Method for Flyover A : Option 2 : Cast In-situ Deck with Conventional Temporary Works)

No.	Activities	Plant	CNP /BS 5228 ref.	No. of PME	On-time %	Unit SWL, dB(A)	SWL, dB(A)	Total SWL, dB(A)[3]
DESIGNATED PROJECT								
Improvement to Pok Oi Interchange								
9	**Construct flyover**	Lorry, 5.5 tonne < gross vehicle weight < 38	[1-d]	1	100%	105	105	**119**
		Bar bender and cutter (electric)	CNP 021	1	100%	90	90	
		Drill/grinder, hand-held (electric)	CNP 065	2	100%	98	101	
		Generator, silenced, 75dB(A) at 7m	CNP 102	1	100%	100	100	
		Concrete lorry mixer	CNP 044	1	100%	109	109	
		Concrete pump, stationary/lorry mounted	CNP 047	1	100%	109	109	
		Poker, vibratory, hand-held	CNP 170	2	100%	113	116	
		Crane, mobile/barge mounted (diesel)	CNP 048	1	100%	112	112	

Notes:

[1] SWLs of the following plant items refer to the document prepared by the Noise Control Authority (http://www.epd.gov.hk/epd/english/application_for_licences/guidance/files/OtherSWLe.pdf)

[1-a] Dump truck, 5.5 tonne < gross vehicle weight < 38 tonne

[1-b] Crane lorry, 5.5 tonne < gross vehicle weight < 38 tonne

[1-c] Paint line remover

[2] Reference was made to "Project Profile for Prince Edward Station Pedestrian Subway Extension and Entrance Modification Works (Register No. PP-253/2005)"

[3] The figures are rounded-up to a whole number.

NOTES:

1. DIMENSIONS WERE IN MILLIMETERS UNLESS OTHERWISE STATED.
2. LEVELS WERE IN METERS AND REFERRED TO PRINCIPAL DATUM (P.D.)
3. ALL EXPOSED EXTERNAL ARISES OF 90° OR LESS WERE TO HAVE A 20x20 CHAMFER UNLESS OTHERWISE STATED.
4. NON-WOVEN POLYPYLENE GEOTEXTILE FILTER WERE PROVIDED AND FIXED ON WALL BACK.
5. GRADE OF CONCRETE:

   WALL & FOOTING 40/20
   BLINDING 10/20
6. COVER TO REINFORCEMENT :

   FOOTING 50mm
   WALL 50mm
7. STEEL WERE GRADE 43A WELDABLE STRUCTURAL STEEL COMPLYING WITH BS 4360.
8. STEELWORK WERE HOT DIP GALVANISED TO BS 729 AFTER FABRICATION.
9. WELDING WERE IN ACCORDANCE WITH BS 5135 AND ELECTRODES WERE IN ACCORDANCE WITH BS 639.
10. STEEL REINFORCEMENT WERE COMPLIED WITH THE REQUIREMENTS OF CS2 AND WERE IN ACCORDANCE WITH BS 4466.
11. REINFORCEMENT BAR MARK SYSTEM WAS READ THUS:

    57 T32 - 19 - 150 T (V)
    - 57 — NOS. OF BAR
    - T — DIAMETER OF BAR
    - 32 — BAR MARK
    - 19 — SPACING OF BAR
    - 150 — LOCATION
12. UNLESS OTHERWISE STATED, MINIMUM LAP LENGTH WAS 46 TIMES THE DIAMETER OF THE SMALLER BAR
13. CONCRETE FINISHES :

    FORMED SURFACE

    (i) EXPOSED SURFACE
    (ii) UNEXPOSED SURFACE

    UNFORMED SURFACE

    (i) EXPOSED SURFACE
    (ii) UNEXPOSED SURFACE
14. FOOTINGS WERE FOUNDED ON MATERIAL WITH MINIMUM ALLOWABLE BEARING CAPACITY OF 150KPa.
15. THIS DRAWING WAS READ IN CONJUNCTION WITH DRC. NOS. NHHY9901-GA0601Z TO GA0603Z.
16. STAINLESS STEEL WERE COMPLIED WITH BS1449.
19. ALL GALVANISED STRUCTURAL STEELWORKS WERE PAINTED IN ACCORDANCE WITH PAINTING SYSTEM F OF THE P.S. CLAUSE 18.62.
20. NOISE BARRIER AND FIXING COMPLIED A PROPRIETORY SYSTEM (MONT BANC).

Notes:

72.8 Predicted noise level exceeded the corresponding criteria.

(a) Noise Contribution due to the Project is calculated by subtracting the noise level without the Project from the overall noise level with the Project.

(b) Ground floor level of JCCAH1 is plant room and lobby. Therefore, it is not considered as noise sensitive.

			8(B)	107	160	-52	3	58
			12	106	160	-52	3	57

Note:

[1] The figures are rounded-up to a whole number.

[2] Maximun total SWL from different groups was adopted for calculation.

[3] A 5 dB(A) reduction provided by the use of movable noise barriers.

[4] The predicted construction noise level complied with the daytime EIAO-TM noise criteria for residential premises and education institutions during normal teaching period. All construction works should be suspended during the examination period.

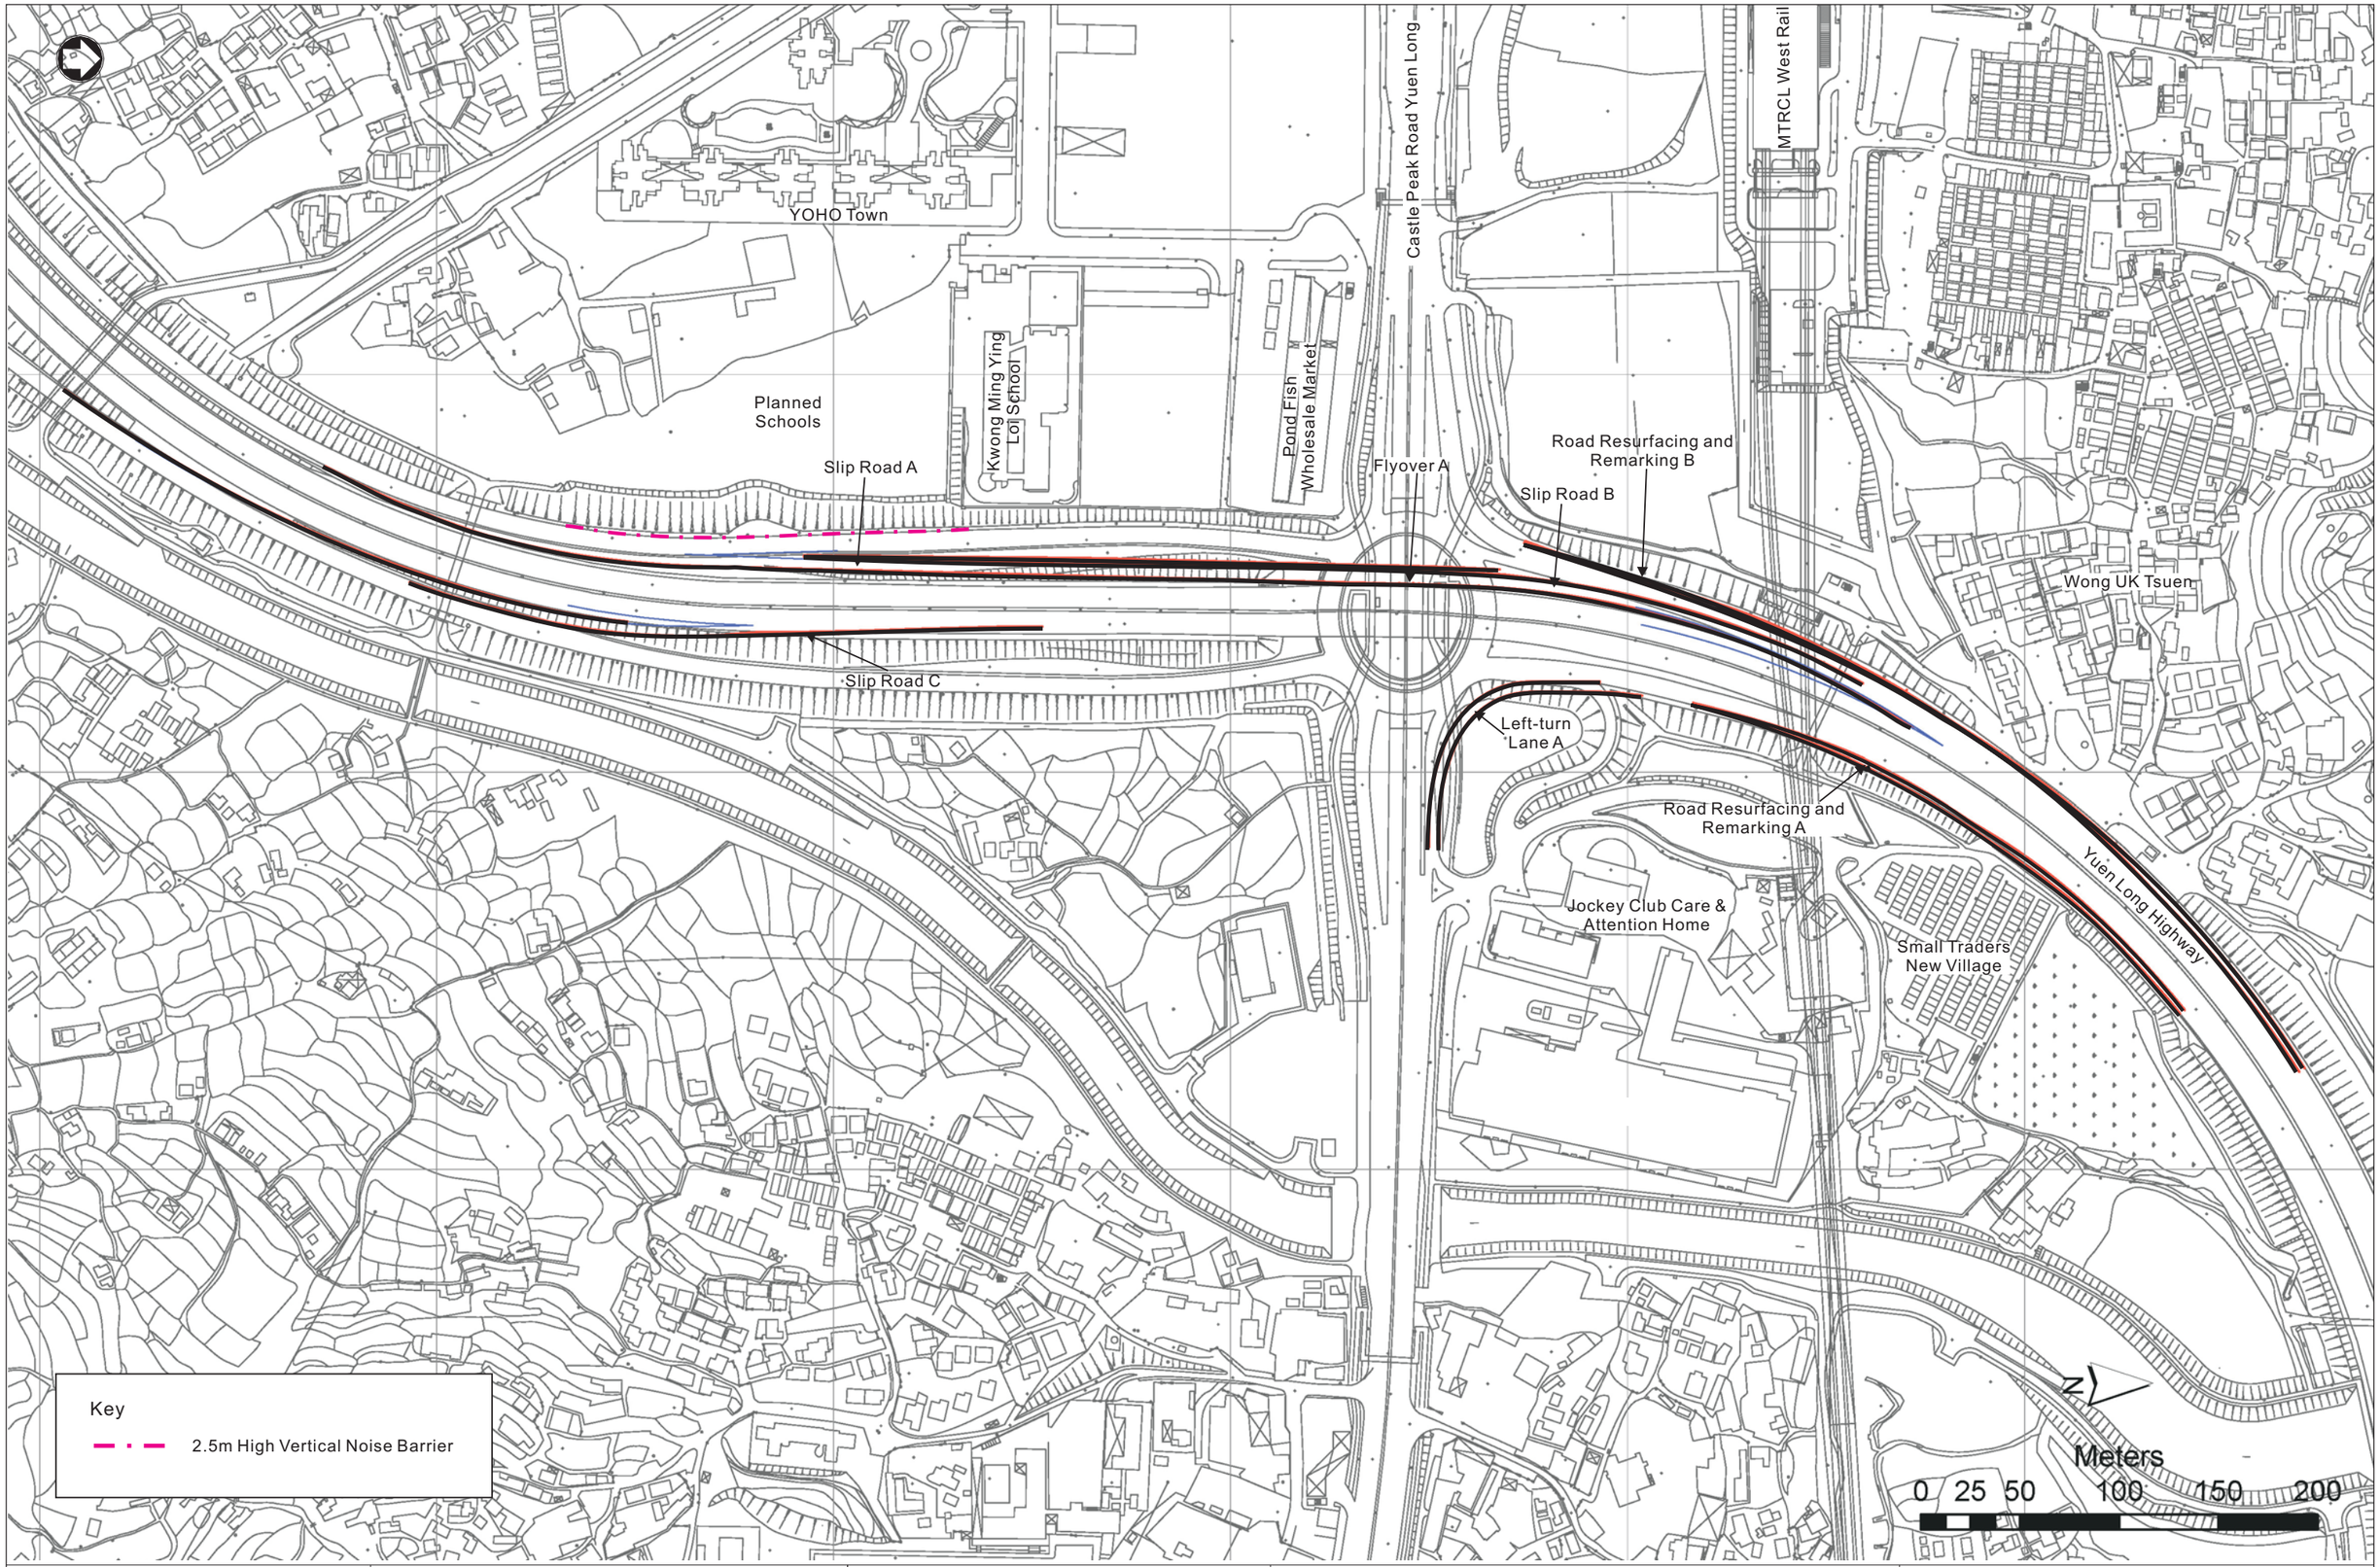
Notes:

72.8 Predicted noise level exceeded the corresponding criteria.

(a) Proposed Noise Mitigation Measures: 1m high vertical noise barrier for Planned Schools & 2m setback of noise barrier for bus sight-line

(b) Noise Contribution due to the Project is calculated by subtracting the noise level without the Project from the overall noise level with the Project.

(c) Ground floor level of JCCAH1 is plant room and lobby. Therefore, it is not considered as noise sensitive.



Highways Department, The Government of the Hong Kong Special Administrative Region	Consultant: Environmental Resources Management (ERM); Halcrow China Ltd. As Engineering Sub-consultant	Agreement No.: WD 6/2007	Environmental Impact Assessment Report
		Project Title: Improvement to Pok Oi Interchange - Environmental Impact Assessment Study	Figure Title: PROPOSED NOISE MITIGATION MEASURES

Notes:
Calculation Example for Year 2011

Updated PC+LGV (1) = [PC+LGV (1) in 2011 {Annex D2}] + [Tech. Frac. PC+LGV (3) PC All in 2003 {Annex D1-1}] x [PC+LGV(3) in 2011 {Annex D2}]
- [Tech. Frac. LGV(3) under PC+LGV(1) in 2003 {Annex D1-1}] x [PC+LGV(1) in 2011 {Annex D2}]
- [Tech. Frac. LGV(4) under PC+LGV(1) in 2003 {Annex D1-1}] x [PC+LGV(1) in 2011 {Annex D2}]

i.e. 22607 = [22671 + (50% x 2) - (0.0265% x 22671) - (0.2602% x 22671)]

Updated PC+LGV (3) = [PC+LGV (3) in 2011 {Annex D2}] - [Tech. Frac. PC All under PC+LGV (3) in 2003 {Annex D1-1}] x [PC+LGV(3) in 2011 {Annex D2}]
+ [Tech. Frac. LGV(3) under PC+LGV(1) in 2003 {Annex D1-1}] x [PC+LGV (1) in 2011 {Annex D2}]

i.e. 7 = [2 - (50% x 2) + (0.0265% x 22671)]

Updated PC+LGV (4) = [PC+LGV (4) in 2011 {Annex D1-1}] + [Tech. Frac. LGV(4) under PC+LGV(1) in 2003 {Annex D1-1}] x [PC+LGV (1) in 2011 {Annex D2}]

i.e. 1679 = 1620 + (0.2602% x 22671)

Note: The vehicle flow in each hour is derived from the hourly variation partern in the nearly core station no. 5019 - Castle Peak Road - Yuen Long in Annual Traffic Census 2006.
Link No. 1-4 are outside of 500m Study Boundary and therefore not used in the current assessment.

3 LGV2.5-3.5t - Diesel Private Cars & Light Goods Vehicles 2.5-3.5t
4 Public Light Bus
5 LGV>3.5t - Light Goods Vehicles>3.5t
6 HGV<15t - Medium & Heavy Goods Vehicles with GVW 5.5-15t
7 HGV>15t - Medium & Heavy Goods Vehicles with GVW >=15t
8 FBDD - Double Deck Franchised Buses
9 MC - Motor Cycles
10 Taxi - Taxi (LPG)
11 PrLB<3.5t - Private Light Buses <3.5t
12 PrLB>3.5t - Private Light Buses >3.5t
13 NFB<6.4t - Non-franchised Buses <6.4t
14 NFB6.4-15t - Non-franchised Buses 6.4-15t
15 NFB>15t - Non-franchised Buses>15t
16 FBSD - Single Deck Franchised Buses

The calculated VMTs are multiplied by 1000 for the subsequent use of EMFACHK emission factor calculations

* Ratio of LPG and diesel PLB was determined with reference to Table 4.4 in the Monthly Transport Digest (Apr 2008). (ie. Ratio of LPG vs Diesel PLB = Licensed LPG PLB/Total Licensed PLB : Licensed Diesel PLB/Total Licensed PLB = 2551/4349 : 1798/4349 = 58:42)

Ratio of LPG and diesel PrLB was determined with reference to Table 4.4 in the Monthly Transport Digest (Apr 2008). (ie. Ratio of LPG vs Diesel PLB = Licensed LPG PrLB/Total Licensed PrLB : Licensed Diesel PrLB/Total Licensed PrLB = (250+4)/1909: 1655/1909 = 13:87)

Annex D5

Total Daily Emission in Year 2011 to 2026

Annex D5 - Total Daily Emission in Year 2011 to 2026

Total Daily NOx emissions (ton/day) by 16 vehicle classes in Year 2011 to 2026 **(80kph)**

Annex F

Implementation Schedule

F1 IMPLEMENTATION SCHEDULE

F1.1 INTRODUCTION

This *Annex* summarises all the mitigation measures recommended in the *EIA Study* and presents them in the form of an Implementation Schedule in accordance with the requirements of Section 3.4.7.3 of the *EIA Study Brief No. ESB-166/2007*.

The Implementation Schedule has the following column headings:

EIA Ref

This denotes the section number or reference from the EIA Report Main text.

EM&A Ref

This denotes the sequential number of each of the recommended mitigation measures specified in the Implementation Schedule.

Recommended Mitigation Measures

This denotes the recommended mitigation measures, courses of action or subsequent deliverables that are to be adopted, undertaken or delivered to avoid, reduce or ameliorate predicted environmental impacts.

Objectives of the Recommended Measure and Main Concerns to be Addressed

This denotes the objectives of the recommended mitigation measures and main concerns to address.

Location

This indicates the spatial area in which the recommended mitigation measures are to be implemented together with details of the programming or timing of their implementation.

Who to Implement the Measure

This denotes where the responsibility lies for the implementation of the recommended mitigation measures.

When to Implement the Measure

This denotes the stage at which the recommended mitigation measures are to be implemented either during the Design, Construction or Operation phases.

What Requirements or Standards for the Measure to Achieve

This defines the controlling legislation that is required to be complied with.

Table F1.1a Implementation Schedule

EIA Ref.	EM&A Ref	Environmental Protection Measures	Objectives of the Recommended Measure & Main Concerns to address	Location of the Measures	Who to implement the measure?	When to implement the measure? (1) D C O	What requirements or standards for the measure to achieve?
Noise – Construction Phase							
4.7.1	N1	Adopt good site practice listed below: • Only well-maintained plant will be operated on-site and plant should be serviced regularly during the construction program; • Silencers or mufflers on construction equipment should be utilized and will be properly maintained during the construction program; • Mobile plant, if any, will be sited as far from NSRs as possible; • Machines and plant (such as trucks) that may be in intermittent use will be shut down between work periods or should be throttled down to a minimum; • Plant known to emit noise strongly in one direction will, wherever possible, be orientated so that the noise is directed away from the nearby NSRs; and • Material stockpiles and other structures will be effectively utilised, wherever practicable, in screening noise from on-site construction activities. • Noisy construction activities, including piling,	To minimise potential construction noise nuisance.	All construction work areas	Contractor	✓	*Noise Control Ordinance (NCO) and EIAO-TM Annex 5*

(1) D=Design; C=Construction; and O=Operation

		excavation and earth-breaking works, will be carried out outside the examination periods of Kwong Ming Ying Loi School.							
4.7.1	N2	Use of quiet powered mechanical equipment	To minimise potential construction noise nuisance.	All construction work areas	Contractor		✓		*Noise Control Ordinance (NCO) and EIAO-TM Annex 5*
4.7.1	N3	Use of acoustic enclosure	To minimise potential construction noise nuisance.	All construction work areas	Contractor		✓		*Noise Control Ordinance (NCO) and EIAO-TM Annex 5*
4.7.1	N4	Adoption of Movable Noise Barriers. The barrier material shall have a surface mass of not less than 7 kg/m^2 on skid footing.	To minimise potential construction noise nuisance.	At locations shown in *Figure 4.7* of the *EIA Report*	Contractor		✓		*Noise Control Ordinance (NCO) and EIAO-TM Annex 5*
4.9.1	N5	Weekly noise monitoring	Ensure noise generated from the Project meets the criteria	At monitoring locations shown in *Figure 4.1* of the *EM&A Manual*	ET		✓		*Noise Control Ordinance (NCO) and EIAO-TM Annex 5*
Noise – Operation Phase									
4.9.2	N6	Traffic noise monitoring – twice at 6-month intervals within the first year upon completion of the Project.	Ensure noise generated from the Project meets the criteria	At monitoring locations shown in *Figure 4.1* of the *EM&A Manual*	ET			✓	*Noise Control Ordinance (NCO) and EIAO-TM Annex 5*
Air Quality – Construction Phase									
5.7.1	AQ1	Adopt good site practices and dust control measures	To minimise potential	All construction work	Contractor		✓		*Air Pollution Control*

EIA Ref.	EM&A Ref	Environmental Protection Measures	Objectives of the Recommended Measure & Main Concerns to address	Location of the Measures	Who to implement the measure?	When to implement the measure? (1) D C O	What requirements or standards for the measure to achieve?
		listed below: • Any stockpile of dusty material will be covered entirely with impervious sheeting or sprayed with water so as to maintain the entire surface wet; • Where a site boundary adjoins a road, or other area accessible to the public, hoarding shall be provided a long the entire length of that portion of the site boundary; • All dusty materials will be sprayed with water immediately prior to any loading, unloading or transfer operation so as to maintain the dusty materials wet; • Where a vehicle leaving the works site is carrying a load of dusty materials, the load will be covered entirely with clean impervious sheeting to ensure that the dusty materials do not leak from the vehicles; • The working area of any demolition, excavation or earth moving operation will be sprayed with water or dust suppression chemicals immediately after the operation so as to maintain the entire surface wet; • The construction plants will be regularly maintained to avoid the emissions of black smoke; and • The construction plants will be switched off when not in use to avoid gaseous emissions.	dust nuisance	areas			*(Construction Dust) Regulations* *HKAQO and EIAO-TM Annex 4*
Water Quality – Construction Phase							

EIA Ref.	EM&A Ref	Environmental Protection Measures	Objectives of the Recommended Measure & Main Concerns to address	Location of the Measures	Who to implement the measure?	When to implement the measure? (1) D C O	What requirements or standards for the measure to achieve?
6.6.1	WQ1	<u>Construction Site Run-off and Drainage</u>					
		• Silt removal facilities such as silt traps or sedimentation facilities should be provided to remove silt particles from runoff to meet the requirements of the WPCO-TM standard. The design of silt removal facilities should be based on the guidelines provided in *ProPECC PN 1/94*. All drainage facilities and erosion and sediment control structures should be inspected monthly and maintained to ensure proper and efficient operation at all times and particularly during rainstorms.	To minimise potential water quality impacts arising from the construction works	All construction work areas	Contractor	✓	*ProPECC PN 1/94* *Water Pollution Control Ordinance (WPCO)* *EIAO-TM Annex 6*
		• Careful programming of the works to minimise surface excavations for the Project during the wet season. If excavation of soil cannot be avoided during the wet season, exposed slope surfaces should be covered by tarpaulin or other means. Other measures that need to be implemented before, during, and after rainstorms are summarised in *ProPECC PN 1/94*. • Exposed soil surfaces should be protected by paving or fill material as soon as possible to reduce the potential of soil erosion. • Open stockpiles of construction materials or construction wastes on-site of more than 50m3 should be covered with tarpaulin or similar fabric during rainstorms. These materials should not be placed near water courses. • A Drainage Management Plan (DMP) should be					

EIA Ref.	EM&A Ref	Environmental Protection Measures	Objectives of the Recommended Measure & Main Concerns to address	Location of the Measures	Who to implement the measure?	When to implement the measure? (1) D C O	What requirements or standards for the measure to achieve?
		prepared by the Contractor and submitted to EPD before the commencement of any construction works to detail the procedures for control of construction site runoff. No site run-off or drainage should be allowed enter the nearby WSRs.					
6.6.1	WQ2	<u>General Construction Activities</u>					
		• Debris and refuse generated on-site should be collected, handled and disposed of properly to avoid entering the nearby WSRs. Stockpiles of cement and other construction materials should be kept covered when not being used.	To minimise potential water quality impacts arising from the construction works	All construction work areas	Contractor	✓	*ProPECC PN 1/94* *Water Pollution Control Ordinance (WPCO)* *EIAO-TM Annex 6*
		• Oils and fuels should only be used and stored in designated areas which have pollution prevention facilities. All fuel tanks and storage areas should be provided with locks and be sited on sealed areas, within bunds of a capacity equal to 110% of the storage capacity of the largest container or 20% by volume of the chemical waste stored in that area, whichever is the greatest. The bund should be drained of rainwater after a rain event.					
6.6.1	WQ3	<u>Sewage generated from On-site Workforce</u>	To minimise potential water quality impacts arising from the construction works	All construction work areas	Contractor	✓	*ProPECC PN 1/94* *Water Pollution Control Ordinance (WPCO)* *EIAO-TM Annex 6*
		• Temporary sanitary facilities, such as portable chemical toilets, should be employed on-site. A licensed contractor would be responsible for appropriate disposal and regular maintenance of these facilities.					
6.6.1	WQ4	<u>Piling Activities</u>					
			To minimise potential	All construction work			*ProPECC PN 1/94*

EIA Ref.	EM&A Ref	Environmental Protection Measures	Objectives of the Recommended Measure & Main Concerns to address	Location of the Measures	Who to implement the measure?	When to implement the measure? (1) D	C	O	What requirements or standards for the measure to achieve?
		• Silt removal facilities such as silt traps or sedimentation facilities should be provided to remove silt particles from groundwater to meet the requirements of the *WPCO-TM* standard. The design of silt removal facilities should be based on the guidelines provided in ProPECC PN 1/94. All drainage facilities and erosion and sediment control structures should be inspected and maintained on a regular basis to ensure proper and efficient operation at all times and particularly during rainstorms.	water quality impacts arising from the construction works	areas	Contractor		✓		*Water Pollution Control Ordinance (WPCO)* *EIAO-TM Annex 6*
Water Quality – Operation Phase									
6.6.2	WQ5	Standard HyD road gullies will be installed along the road drainage system to trap any silt and grit in the first flush of runoff.	To minimise potential water quality impacts on surface water.	All construction work areas	HyD/ Contractor	✓	✓	✓	*WPCO* *Technical Memorandum Standards for Effluents Discharged into Drainage and Sewerage Systems, Inland and Inshore Waters (Water-TM)* *EIAO-TM Annex 6*
Waste Management – Construction Phase									
7.5.1	WM1	All the necessary waste disposal permits are obtained prior to the commencement of construction work.	To ensure compliance with relevant statutory requirements	Before construction works commence	Contractor	✓	✓		*WDO*
7.5.1	WM2	<u>Management of Waste Disposal</u> The construction contractor will open a billing account	To ensure that adverse	All construction work	Contractor		✓		*WDO*

EIA Ref.	EM&A Ref	Environmental Protection Measures	Objectives of the Recommended Measure & Main Concerns to address	Location of the Measures	Who to implement the measure?	When to implement the measure? (1) D	C	O	What requirements or standards for the measure to achieve?
		with the EPD. Every construction waste or public fill load to be transferred to the Government waste disposal facilities such as public fill reception facilities, sorting facilities, landfills will required a valid "chit" which contains the information of the account holder to facilitate waste transaction recording and billing to the waste producer. A trip-ticket system will also be established to monitor the disposal of construction waste at the Landfill and to control fly-tipping. The trip-ticket system will be included as one of the contractual requirements and implemented by the contractor. A recording system for the amount of waste generated, recycled and disposed of (including the disposal sites) will be established.	environmental impacts are prevented	areas					*Waste Disposal (Charges for Disposal of Construction Waste) Regulation;* *Works Bureau Technical Circular No.31/2004; and* *Annex 5 and Annex 6 of Appendix G of ETWBTC No. 19/2005)*
7.5.1	WM3	<u>Measures for the Reduction of Construction Waste Generation</u>							
		Inert and non-inert construction waste will be segregated and stored in different containers or skips to facilitate reuse or recycling of the inert waste and proper disposal of the non-inert construction waste. Specific areas of the work site will be designated for such segregation and storage if immediate use is not practicable.	To reduce construction waste generation	All construction work areas	Contractor		✓		*WDO* *EIAO-TM Annex 7*
7.5.2	WM4	<u>Management of Waste Disposal</u>							
		The construction contractor will open a billing account with the EPD. Every construction waste or public fill load to be transferred to the Tuen Mun Area 38 Public Filling Area or other approved designated public fill	To reduce construction waste generation	All construction work areas	Contractor		✓		*WDO* *Waste Disposal (Charges for Disposal of Construction*

		facilities will require a valid "chit". A trip-ticket system will also be established to monitor the disposal of construction waste at the Tuen Mun Area 38 Public Filling Area or other approved designated public fill facilities, and to control fly-tipping.							*Waste) Regulation & Works Bureau Technical Circular No.31/2004*
7.5.3	WM5	<u>Chemical Waste</u>							
		The construction contractor will register as a chemical waste producer with the EPD. Chemical waste will be handled in accordance with the *Code of Practice on the Packaging, Handling and Storage of Chemical Wastes.*	To ensure proper handling of chemical waste	All construction work areas	Contractor		✓		*WDO* *Code of Practice on the Packaging, Handling and Storage of Chemical Wastes*
7.5.4	WM6	<u>Staff Training</u>							
		At the commencement of the construction works, training will be provided to workers on the concepts of site cleanliness and on appropriate waste management procedures, including waste reduction, reuse and recycling.	To ensure that adverse environmental impacts are prevented	All construction work areas	ET		✓		-
7.8	WM7	<u>Environmental Monitoring & Audit Requirements</u>							
		Monthly audits of the waste management practices will be carried out during the construction phase to determine if wastes are being managed in accordance with the good site practices described in this *EIA Report*. The audits examine all aspects of waste management including waste generation, storage, recycling, transport and disposal.	To ensure that adverse environmental impacts are prevented	All construction work areas	Contractor		✓		*WDO*
Landscape and Visual – Construction Phase									

EIA Ref.	EM&A Ref	Environmental Protection Measures	Objectives of the Recommended Measure & Main Concerns to address	Location of the Measures	Who to implement the measure?	When to implement the measure? (1)			What requirements or standards for the measure to achieve?
						D	C	O	
8.7.11	LV1	*LMM 5 – Early Planting Works.* Where technically feasible, new plantings are to be installed as early as possible during the construction works.	To reduce construction impacts on Landscape	Where technically feasible	Contractor	✓	✓		*EIAO-TM Annexes 10, 18, ETWB TCW 2/2004, ETWB TCW 3/2006*
8.7.11	LV2	*LMM 6 – Site hoardings to be compatible with the surrounding environment.* Where possible site hoardings to be coloured to complement the surrounding areas. Colours such as green and light brown are recommended.	To reduce construction impacts on Landscape	All construction work areas	Contractor		✓		*EIAO-TM Annexes 10, 18, ETWB TCW 2/2004, ETWB TCW 3/2006*
Landscape and Visual –Operation Phase									
8.7.11	LV3	*Cultivation of areas compacted during construction.* Areas compacted during the construction phase that are not required during the operation phase, are to be cultivated to a depth of up to 300mm in accordance with the future Landscape Specification.	To assist in establishment of vegetation to reduce landscape impacts	All construction work areas where new plantings are to be installed	Contractor/ HyD	✓	✓	✓	*EIAO-TM Annexes 10, 18, ETWB TCW 2/2004, ETWB TCW 3/2006*
8.7.11	LV4	*Soil stabilisation and planting.* During the design phase, a soil stabilisation and embankment planting strategy will be developed to ensure that land affected by slope excavation can be replanted. Soil preparation and the selection and provision of suitable growing medium is to be completed in accordance with the relevant best practice guidelines.	To reduce landscape impacts	All construction work areas in slope areas	Contractor/ HyD	✓	✓	✓	*EIAO-TM Annexes 10, 18, ETWB TCW 2/2004, ETWB TCW 3/2006*
8.7.11	LV5	*Tree and Shrub Planting.* All planting of trees and shrubs is to be carried out in accordance with the relevant best practice guidelines. Plant densities are to be provided in future detailed design documents and are to be selected so as to achieve a finished landscape that matches the surrounding, undisturbed, equivalent landscape types.	To reduce landscape impacts	All available following construction	Contractor/ HyD	✓	✓	✓	*EIAO-TM Annexes 10, 18, ETWB TCW 2/2004, ETWB TCW 3/2006*

EIA Ref.	EM&A Ref	Environmental Protection Measures	Objectives of the Recommended Measure & Main Concerns to address	Location of the Measures	Who to implement the measure?	When to implement the measure? (1)			What requirements or standards for the measure to achieve?
						D	C	O	
8.7.11	LV6	*LMM 4 - Relocation.* Landscape Resources of value to be re-located where practically feasible.	To reduce landscape impacts and retain valuable LRs	As required	Contractor/ HyD	✓	✓	✓	*EIAO-TM Annexes 10, 18, ETWB TCW 2/2004, ETWB TCW 3/2006*
8.8.9	LV7	*Design of Structures.* Built structures, in particular noise barriers that will be setback and reprovisioned will be utilise appropriate designs to complement the surrounding landscape. Materials and finishes will also be considered during detailed design.	To reduce visual impacts	Noise barriers	Contractor/ HyD	✓	✓	✓	*EIAO-TM Annexes 10, 18, ETWB TCW 2/2004, ETWB TCW 3/2006*
8.8.9	LV8	*Design of noise barriers*. The 2.5m high vertical noise barrier for the planned schools will be in the form of concrete structure installed with barrier panels to align with the existing provision in the vicinity and to integrate into the landscape.	To reduce visual impacts	Noise barriers	Contractor/ HyD	✓	✓	✓	*EIAO-TM Annexes 10, 18, ETWB TCW 2/2004, ETWB TCW 3/2006*
8.8.9	LV9	*Plantings* In addition to the landscape mitigation plantings proposed, appropriate new plantings will be installed as appropriate to help integrate the new structures into the surrounding landscape.	To reduce visual impacts	All construction work areas	Contractor/ HyD	✓	✓	✓	*EIAO-TM Annexes 10, 18, ETWB TCW 2/2004, ETWB TCW 3/2006*
