

## **Appendix 3-11**

### **Sensitivity Test on Cumulative Construction Phase TSP, RSP and FSP Levels with the “Yau Mei Site” Project**

## **Appendix 3-11 Cumulative Impacts Due to Concurrent Construction with Approved “Yau Mei Site” Project**

### **1 Introduction**

The planned “Yau Mei Site” project’s EIA report was recently approved. Air quality impact due to Site formation works of that project has been assessed in its EIA report. Given to the fact that the concerned “Yau Mei Site” project is distant away from this Project with a shortest separation distance over 360m between the site boundary of this Project and planned “Yau Mei Site” project boundary, construction of that project is unlikely to result in any adverse impacts. There is currently no existing ASRs between the two project sites. Air quality impact of that Project will be controlled through the implementation of mitigation measures committed for that project under its EIA study.

Nevertheless, this sensitivity test has been undertaken in order to evaluate potential cumulative impacts due to concurrent construction of these two projects. Air quality impact due to construction works of the planned “Yau Mei Site” project has been extracted from the approved EIA report of that project. Cumulative air pollutants levels have also been calculated accordingly.

### **2 Construction Programme and Construction Sequence of Planned “Yau Mei Site” Project**

Construction programme of the planned “Yau Mei Site” project is presented in **Appendix 3-1A** of this EIA report. According to its construction programme, the site formation works of that project would be carried out between December 2015 and April 2017. In which, the peak site formation works would be carried out between December 2015 and November 2016 (i.e. a period of 12 months where most of the filling and excavation activities are involved).

For the purpose of this sensitivity test, a conservative approach has been adopted by assuming that the peak site formation works of “Yau Mei Site” project would be carried out concurrently with the site formation works of this Project in order to assess the cumulative impact (i.e. a worst case scenario).

### **3 Assessment Methodology**

#### **3.1 Emission Sources**

Based on information in the approved EIA Report for planned “Yau Mei Site” project, the site formation works of residential area (Phases B to D) has been identified as the dust emission sources of that project, which was modelled as area sources. Currently, planned “Yau Mei Site” is a green field site and is covered by grass. During the construction phase, construction works will be carried out in phases and the grass land at the unaffected area will be maintained so that the soil underneath is not exposed to the atmosphere (i.e. there will be no wind erosion).

According to the information obtained, each of the Phases B, C, and D works area will be divided into 7 sub-zones (i.e. a total of 21 sub-zones as shown in the phasing plan below). Within each Phase, only one sub-zone will be under construction in any one time in order to avoid cumulative impacts. Thus, construction works within the active sub-zone will be the only emission source since the remaining areas of the Project Site is covered by grass and will not be affected (i.e. no dust emission for the remaining areas). Once construction for a sub-zone is completed, the works area will be compacted, covered by tarpaulin sheet and hydroseeded before construction of another zone. Watering will also be applied on regular basis. Thus, there will be no cumulative construction impacts.

Information such as emission factors, construction sequence and locations, etc. under its mitigated scenario were directly extracted from the approved EIA report of “Yau Mei Site” project which are also attached with this document (Please refer to **Annex 1** for the extracted information).

As discussed above, peak site formation period of “Yau Mei Site” project has been used in the assessment in order to represent a worst case scenario. Thus, for short-term (hourly and daily) and long-term impact (annual), it has been based on the peak site formation period between December and November (i.e. a period of 12 months) where most of the filling and excavation materials are involved during site formation stage.

### 3.2 Emission Strength

Emission factors due to construction of the “Yau Mei Site” project were directly extracted from its approved EIA report, which is also shown in **Annex 1**.

### 3.3 Assessment Approach

In the approved “Yau Mei Site” project EIA report, the same set of ASRs that may be affected by both projects, were identified and assessed (the locations of ASRs assessed in the approved “Yau Mei Site” project are shown in **Annex 2**). The predicted TSP, RSP and FSP concentrations due to construction of the “Yau Mei Site” project were extracted and presented in **Annex 2**.

The TSP, RSP and FSP concentrations at the same ASR locations due to this EIA Project was also predicted and presented in **Appendices 3-6** and **3-7** of this EIA report.

Then, cumulative TSP, RSP and FSP concentrations due to concurrent construction of the two projects (i.e. “Yau Mei Site” project and this EIA Project), are calculated and the results are presented in **Annex 3**.

## 4 Assessment Results and Conclusion

According to the sensitivity test results as shown in the summary table in **Annex 3**, the cumulative dust emissions due to concurrent construction of the concerned two project sites would not adversely impact on ASRs as the contribution due to the “Yau Mei Site” Project is very small and insignificant given to the fact that the concerned planned “Yau Mei Site” project is far away from this Project Site.

The calculated cumulative dust levels can also comply with the relevant air quality objectives/ criteria. As such, there will be no adverse cumulative impact during construction stage.

Planned “Yau Mei Site” project  
(Directly Extracted from the Approved “Yau Mei Site” EIA Report)*

## **Annex 1 Details of Phasing Construction During Site Formation Stage of the Approved “Yau Mei Site” Project**

Based on information in the approved EIA Report for planned “Yau Mei Site” project, the site formation works of residential area (Phases B to D) has been identified as the dust emission sources of that project, which was modelled as area sources. Its construction programme was also shown in Appendix 3-1A of this report for reference.

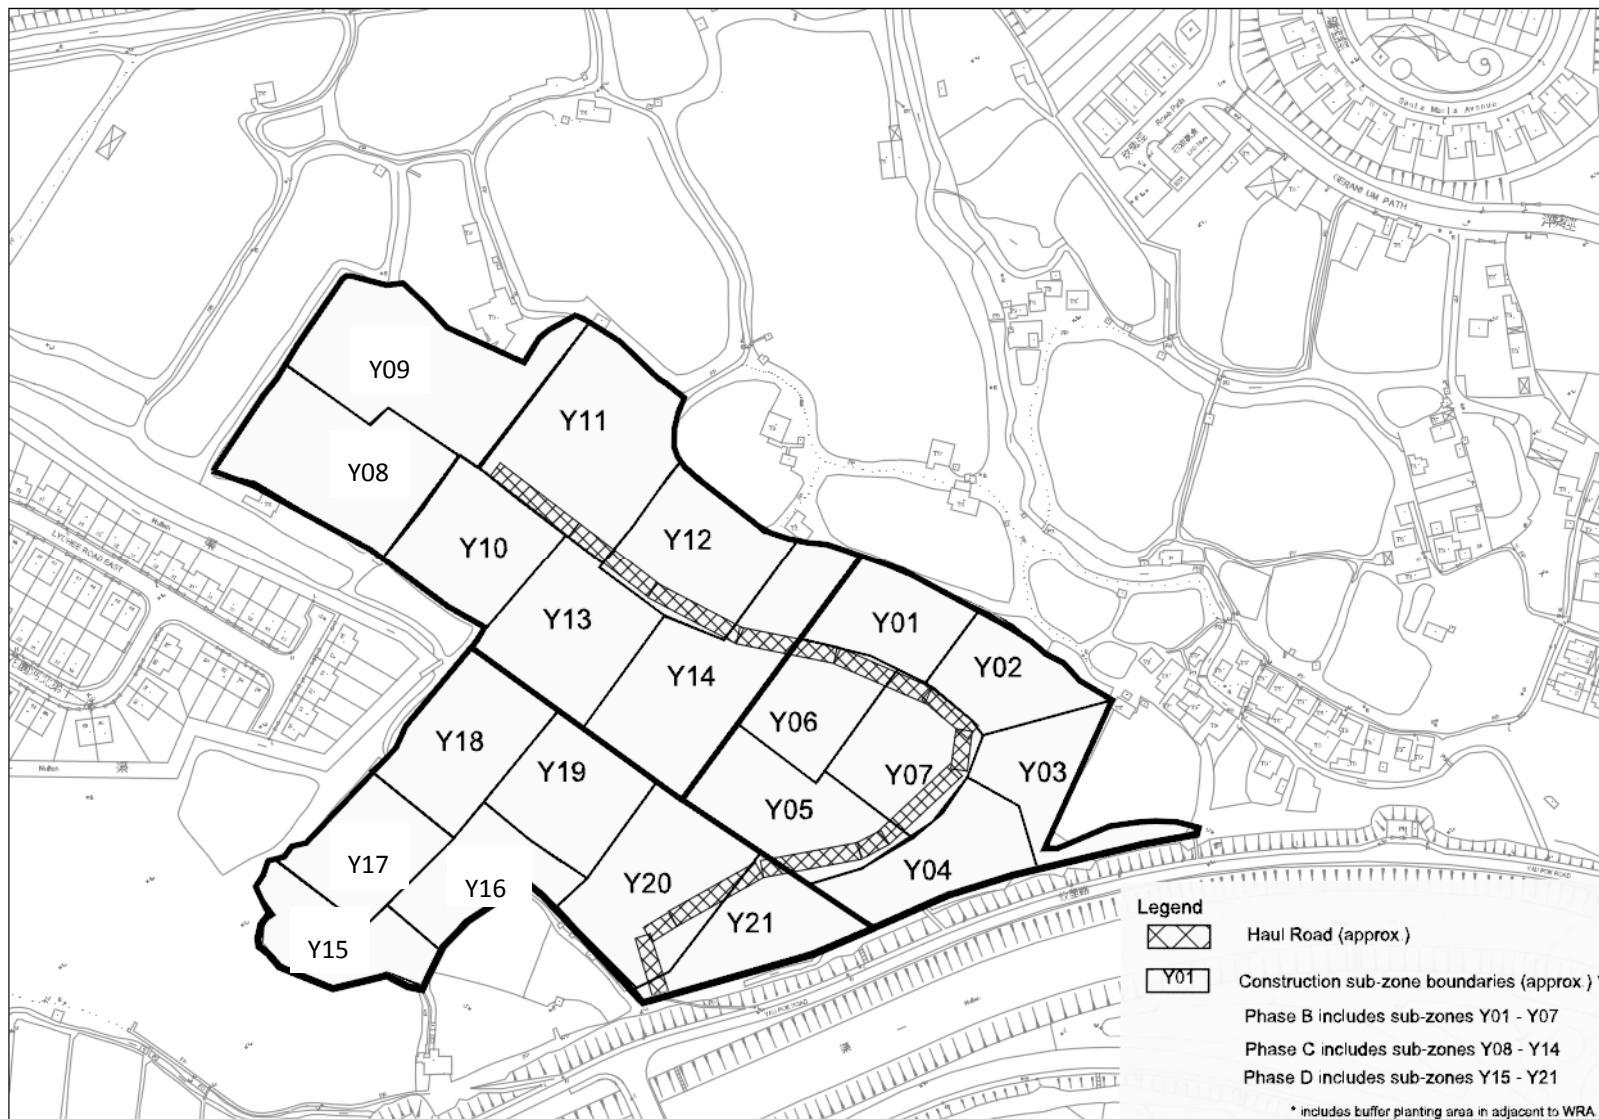

Currently, planned “Yau Mei Site” is a green field site and is covered by grass. During the construction phase, construction works will be carried out in phases and the grass land at the unaffected area will be maintained so that the soil underneath is not exposed to the atmosphere (i.e. there will be no wind erosion).

According to the information obtained, each of the Phases B, C, and D works area will be divided into 7 sub-zones (i.e. a total of 21 sub-zones as shown in the phasing plan below). Within each Phase, only one sub-zone will be under construction in any one time in order to avoid cumulative impacts. Thus, construction works within the active sub-zone will be the only emission source since the remaining areas of the Project Site is covered by grass and will not be affected (i.e. no dust emission for the remaining areas). Once construction for a sub-zone is completed, the works area will be compacted, covered by tarpaulin sheet and hydroseeded before construction of another zone. Watering will also be applied on regular basis. Thus, there will be no cumulative construction impacts.

Information such as emission factors, construction sequence and locations, etc. under its mitigated scenario were directly extracted from the approved EIA report of “Yau Mei Site” project which are also attached with this document.

For short-term (hourly and daily) and long-term impact (annual), it has been based on the peak site formation period between December and November of next year (i.e. 12 months) where most of the filling and excavation materials are involved during site formation stage (i.e. source of emission) to represent a worst case scenario.

Indicative Phasing Plan During Site Formation Stage of the Residential Area of Approved “Yau Mei Site” Project

**Appendix 3-2A Summary Table of Calculated TSP Emissions Modeling Input Data During Filling/ excavation Works (Unmitigated Scenario)**

For both the unmitigated scenario and mitigated scenarios, since there will be no construction activities during restricted hours, and on Sundays and general holidays, the calculated emission rates have been applied to day-time hours during general weekdays only (i.e. 0800 to 1800 hours). While from 1800 to 0800 hours during general workdays, and on Sunday and general holidays (whole day) are adopted for impact assessment of wind erosion on the site.

**Inputs to the ISCST Model:**

Calculated Emission Rate	Emission Rate Factor **
Day-time (A)	2.32E-05
Night-time (B)	2.70E-06 =B/A

**Remark:**

\* Please refer to Appendices 3-2C for the calculation of emission factors.

\*\* For general workdays, in order to simulate calculated emission rate due to wind erosion during nighttime period, the "Emission Rate Factor" is applied from 1800 to 0800 hours in the ISCST model. Similarly, for Sundays and Holidays, the calculated emission rate due to wind erosion during day-time period is simulated by adopting the "Emission Rate Factor" from 0800 to 1800 hours in the ISCST model.

**Remark:**

# Please refer to Appendix 3-9 for calculation of dust suppression efficiency.

## Due to the phased construction area, only limited space and construction plants will be available for construction in any one time. Thus, the construction activities under the "Cut and Cover" category that would contribute to dust emissions will unlikely to operate at the same time. In fact, only one of the above activities will operate in any one time. However, to be conservative, air quality impacts due to simultaneous construction of these activities has been taken into account in the assessment.

\* The equation recommended for concerned particular construction activity as per Section 13.2.3 of USEPA AP-42 regarding heavy construction operation.

\*\* The concerned construction activity of this Project during site formation stage will involve earth movement activities and transportation of excavated/ fill materials, etc. The nature of these activities is similar to that of quarry operation. Thus, the typical silt loading within the range of typical values from quarry site, as stipulated in USEPA AP-42, Table 13.2.1-3, S13.2.1, 11/06 ed., is adopted in the above equation. The reported highest silt loading value has been used in this exercise for worst case scenario. It is noted that similar assumption has also been adopted for paved construction haul road in the approved EIA report, Appendix F of the "EIA-032/1999 - East Rail Extension Hung Hom to Tsim Sha Tsui - Environmental Impact Assessment".

\*\*\* Total site area of Phases B to D as well as buffer planting area along its edge in adjacent to the WRA, is taken as 4.4ha.

**Inputs to the ISCST Model:**

Calculated Emission Rate	Emission Rate Factor **
Day-time (A)	2.26E-05
Night-time (B)	2.70E-06 = B/A

**Remark:**

\* Please refer to Appendices 3-2F for the calculation of emission factors.

\*\* For general workdays, in order to simulate calculated emission rate due to wind erosion during nightime period, the "Emission Rate Factor" is applied from 1800 to 0800 hours in the ISCST model. Similarly, for Sundays and Holidays, the calculated emission rate due to wind erosion during day-time period is simulated by adopting the "Emission Rate Factor" from 0800 to 1800 hours in the ISCST model.

		% of dust suppression #	90.0% for watering 8 times per day #
		Calculated emission rate (mitigated), $g/m/s$	<b>1.68E-04</b>

**Remark:**

# Please refer to Appendix 3-9 for calculation of dust suppression efficiency.

## Due to the phased construction area, only limited space and construction plants will be available for construction in any one time. Thus, the construction activities under the "Cut and Cover" category that would contribute to dust emissions will unlikely to operate at the same time. In fact, only one of the above activities will operate in any one time. However, to be conservative, air quality impacts due to simultaneous construction of these activities has been taken into account in the assessment.

\* The equation recommended for concerned particular construction activity as per Section 13.2.3 of USEPA AP-42 regarding heavy construction operation.

\*\* The concerned construction activity of this Project during site formation stage will involve earth movement activities and transportation of excavated/ fill materials, etc. The nature of these activities is similar to that of quarry operation. Thus, the typical silt loading within the range of typical values from quarry site, as stipulated in USEPA AP-42, Table 13.2.1-3, S13.2.1, 11/06 ed., is adopted in the above equation. The reported highest silt loading value has been used in this exercise for worst case scenario. It is noted that similar assumption has also been adopted for paved construction haul road in the approved EIA report, Appendix F of the "EIA-032/1999 - East Rail Extension Hung Hom to Tsim Sha Tsui - Environmental Impact Assessment".

\*\*\* Total site area of Phases B to D as well as buffer planting area along its edge in adjacent to the WRA, is taken as 4.4ha.

**Calculated Emission Factors for RSP of "Yau Mei Site" Project**

**Inputs to the ISCST Model:**

Calculated Emission Rate *	Emission Rate Factor **
Day-time (A)	8.19E-06
Night-time (B)	1.37E-06

**Remark:**

\* Please refer to Appendices 3-3C for the calculation of emission factors.

\*\* For general workdays, in order to simulate calculated emission rate due to wind erosion during nighttime period, the "Emission Rate Factor" is applied from 1800 to 0800 hours in the ISCST model. Similarly, for Sundays and Holidays, the calculated emission rate due to wind erosion during day-time period is simulated by adopting the "Emission Rate Factor" from 0800 to 1800 hours in the ISCST model.

		% of dust suppression #	90.0% for watering 8 times per day #
		Calculated emission rate (mitigated), $\text{g}/\text{m/s}$	3.22E-05

**Remark:**

# Please refer to Appendix 3-9 for calculation of dust suppression efficiency.

## Due to the phased construction area, only limited space and construction plants will be available for construction in any one time. Thus, the construction activities under the “Cut and Cover” category that would contribute to dust emissions will unlikely to operate at the same time. In fact, only one of the above activities will operate in any one time. However, to be conservative, air quality impacts due to simultaneous construction of these activities has been taken into account in the assessment.

\* The equation recommended for concerned particular construction activity as per Section 13.2.3 of USEPA AP-42 regarding heavy construction operation.

\*\* The concerned construction activity of this Project during site formation stage will involve earth movement activities and transportation of excavated/ fill materials, etc. The nature of these activities is similar to that of quarry operation. Thus, the typical silt loading within the range of typical values from quarry site, as stipulated in USEPA AP-42, Table 13.2.1-3, S13.2.1, 11/06 ed., is adopted in the above equation. The reported highest silt loading value has been used in this exercise for worst case scenario. It is noted that similar assumption has also been adopted for paved construction haul road in the approved EIA report, Appendix F of the “EIA-032/1999 - East Rail Extension Hung Hom to Tsim Sha Tsui - Environmental Impact Assessment”.

\*\*\* Total site area of Phases B to D as well as buffer planting area along its edge in adjacent to the WRA, is taken as 4.4ha.

@ Based on conservative ratio reported in literature. Please refer to Appendix 3-10 for the justification.

**Calculated Emission Factors for RSP of "Yau Mei Site" Project**

**Directly Extracted from Appendix 3-3 on the Approved EIA Report of the “Yau Mei Site” Project (AEIAR-189/2015)**

**Calculation of Emission Factors During Removal of Surcharge**

**Inputs to the ISCST Model:**

Calculated Emission Rate *	Emission Rate Factor **
Day-time (A)	7.88E-06
Night-time (B)	1.37E-06

**Remark:**

\* Please refer to Appendices 3-3F for the calculation of emission factors.

\*\* For general workdays, in order to simulate calculated emission rate due to wind erosion during nightime period, the "Emission Rate Factor" is applied from 1800 to 0800 hours in the ISCST model. Similarly, for Sundays and Holidays, the calculated emission rate due to wind erosion during day-time period is simulated by adopting the "Emission Rate Factor" from 0800 to 1800 hours in the ISCST model.

**Appendix 3-3F Calculation of RSP Emission Rates of the Project Site During Removal of Surcharge (Both Unmitigated and Mitigated Scenarios)**

Type of Work	Type of Emission Source	Parameter	Remark
Wind Erosion on Exposed Ground	(1) Wind Erosion (day-time)	TSP emission factor (Mg/hectare/year)	0.85 USEPA AP-42, S11.9, Table 11.9-4, 7/98 ed.
		Calculated RSP emission factor (Mg/hectare/year)	0.43 Converted from the above TSP emission factor based on a ratio of 0.51 for RSP/TSP. <sup>②</sup>
		Emission rate, g/m <sup>2</sup> /s (unmitigated)	<b>1.37E-06</b> =((0.43*1000000)/10000m <sup>2</sup> /(365*24*60*60))
		% of dust suppression <sup>#</sup>	90.0% for watering 8 times per day <sup>#</sup>
		Emission rate, g/m <sup>2</sup> /s (mitigated)	<b>1.37E-07</b>
	(1) Wind Erosion (night-time)	TSP emission factor (Mg/hectare/year)	0.85 USEPA AP-42, S11.9, Table 11.9-4, 7/98 ed.
		Calculated RSP emission factor (Mg/hectare/year)	0.43 Converted from the above TSP emission factor based on a ratio of 0.51 for RSP/TSP. <sup>②</sup>
		Emission rate, g/m <sup>2</sup> /s (unmitigated)	<b>1.37E-06</b> =((0.43*1000000)/10000m <sup>2</sup> /(365*24*60*60))
Cut and Cover Activities	(2) Bulldozing & Surface Compacting (day-time only)	Eqn.: $E = (0.45(s)^{1.5}/(M)^{1.4}) \times 0.75$	USEPA AP-42, S11.9, Table 11.9-2, 7/98 ed. (Based on the eqn. of particle size <= 15 μm. According to Table 11.9-2 of the AP-42, a scaling factor of 0.75 has been applied to the equation in order to represent RSP emission factor) *
		Material moisture content (%), M	2.2 To represent the worst case scenario, the lowest moisture content within the range specified for overburden in the USEPA AP-42, S11.9, Table 11.9-3, 7/98 ed., is adopted
		Material silt content (%), s	15.1 To represent the worst case scenario, the highest silt content within the range specified for overburden in the USEPA AP-42, S11.9, Table 11.9-3, 7/98 ed., is adopted
		Calculated Emission Factor (kg/hr), E	<b>6.57E+00</b>
		Site Area (m <sup>2</sup> ), A ***	44000 -
		Calculated emission rate (unmitigated) (g/m <sup>2</sup> /s)	<b>4.15E-05</b> = (E*1000)/A/(60*60)
		% of dust suppression <sup>#</sup>	90.0% for watering 8 times per day <sup>#</sup>
		Calculated emission rate, g/m <sup>2</sup> /s (mitigated)	<b>4.15E-06</b> Due to % of dust suppression.
	(3) Removal/ unloading soil materials by excavators (day-time only)	Emission Factor of excavator unloading topsoil (kg/Mg), E1	0.02 USEPA AP-42, S11.9, Table 11.9-4, 7/98 ed. (scraper unloading topsoil is adopted). *
		Topsoil removal by excavator (kg/Mg), E2	0.029 USEPA AP-42, S11.9, Table 11.9-4, 7/98 ed. (Topsoil removal by scraper is adopted). *
		Total Emission by excavator (kg/Mg), E1+E2	4.90E-02
		Calculated RSP Emission by excavator (kg/Mg), E = (E1+E2) x 0.51	2.50E-02 Converted from the above TSP emission factor based on a ratio of 0.51 for RSP/TSP. <sup>②</sup>
		Total quantity of materials involved (m <sup>3</sup> ), Q	105000 The total amount of concerned surcharge materials to be removed as provided by Engineer
		No. of months for site formation (Phase B to D), m	4.5 Total duration of "removal of surcharge" of concerned site formation works.
		No. of working days per month, d	25 From Project Engineer
		No. of working hours per day, h	10 From Project Engineer (working hours = 0800 hr to 1800 hr)
		Average hourly output (m <sup>3</sup> /hr), O1	93.33 = Q/(m*d*h)
		Average hourly output (Mg/hr), O2	233.33 = O1 x 2.5Mg/m <sup>3</sup> . Assuming the truck capacity of 6m3 and 15 tons (i.e. soil density of 2.5 Mg/m3).
		Site Area (m <sup>2</sup> ), A ***	44000 -
		Calculated emission rate (unmitigated) (g/m <sup>2</sup> /s)	<b>3.68E-05</b> = (O2 x (E x 1000)/ A)/(60*60)
		% of dust suppression <sup>#</sup>	90.0% for watering 8 times per day <sup>#</sup>
		Calculated emission rate (mitigated) (g/m <sup>2</sup> /s)	<b>3.68E-06</b>

of the "Yau Mei Site" Project (AEIAR-189/2015)***

Type of Work	Type of Emission Source	Parameter	Remark	
(4) Earth Handling/ Loading, Unloading, and stockpiling (day-time only)	Eqn.: $E = k \times (0.0016) \times ((U/2.2)^{1.3} / (M/2)^{1.4})$		USEPA AP-42, S13.2.4, 11/06 ed. *	
	Particle size multiplier, $k$	0.35	particle size multiplier for particle size of 10 $\mu\text{m}$	
	Mean wind speed (m/s), $U$	1.85	Based on year 2010 average wind speed recorded at Wetland Park Station of Hong Kong Observatory.	
	Material moisture content (%), $M$	2.2	Pls. refer to Works Item no. 2 above	
	Calculated Emission Factor (kg/Mg), $E$	0.00039	$E = k \times (0.0016) \times ((U/2.2)^{1.3} / (M/2)^{1.4})$	
	Total quantity of materials involved ( $\text{m}^3$ ), $Q$	105000	The total amount of concerned surcharge materials to be removed as provided by Engineer	
	No. of months for site formation, $m$	4.5	Total duration of "removal of surcharge" of concerned site formation works.	
	No. of working days per month, $d$	25	From Project Engineer	
	No. of working hours per day, $h$	10	From Project Engineer (working hours = 0800 hr to 1800 hr)	
	Average hourly output ( $\text{m}^3/\text{hr}$ ), $O_1$	93.33	$= Q/(m^d \cdot h)$	
	Average hourly output (Mg/hr), $O_2$	233.33	$= O_1 \times 2.5\text{Mg/m}^3$ . Assuming the truck capacity of 6m <sup>3</sup> and 15 tons (i.e. soil density of 2.5 Mg/m <sup>3</sup> ).	
	Site Area ( $\text{m}^2$ ), $A$ ***	44000	-	
	Calculated emission rate (unmitigated) ( $\text{g}/\text{m}^2/\text{s}$ )	5.74E-07	$= (O_2 \times (E \times 1000)/ A)/(60*60)$	
	% of dust suppression #	90.0%	for watering 8 times per day #	
	Calculated emission rate (mitigated) ( $\text{g}/\text{m}^2/\text{s}$ )	5.74E-08		
	Total Emission for "Cut and Cover" (= (2) + (3) + (4))	Total Emission rate, $\text{g}/\text{m}^2/\text{s}$ (Unmitigated) (day-time only)	7.88E-05	Calculated total emission factor for "Cut and Cover".
		Total Emission rate, $\text{g}/\text{m}^2/\text{s}$ (mitigated) (day-time only)	7.88E-06	Calculated total emission factor for "Cut and Cover" ##.
Vehicle movement on Haul Road	(5) Paved Haul Road (day-time only)	Eqn.: $E = k \times (sL)^{0.91} \times (W)^{1.02}$	USEPA AP-42, S13.2.1, 11/06 ed.	
		Particle size multiplier (g/VKT), $k$	0.62 USEPA AP-42, S13.2.1, 11/06 ed., Table 13.2.1-1 for PM-10.	
		Road surface silt loading ( $\text{g}/\text{m}^2$ ), $sL$	14 To represent the worst case scenario, the highest silt loading within the range of typical values specified for quarry operation in the USEPA AP-42, S13.2.1, 1/11 ed., Table 13.2.1-3, is adopted. **	
		Mean vehicle weight (tons), $W$	16 The average weight of the empty truck and full load truck.	
		Calculated Emission Factor (g/VKT), $E_1$	115.76 $E = k \times (sL)^{0.91} \times (W)^{1.02}$	
		Calculated emission factor (g/v-m), $E_2$	0.116 $= E_1/1000$	
		Average no. of trucks (veh./hr), $T$	10 Estimated maximum no. of trucks per hour from Engineer	
		Calculated emission rate (unmitigated), $\text{g}/\text{m}^2/\text{s}$	3.22E-04 $= E_2 \times (T/60*60)$	
		% of dust suppression #	90.0% for watering 8 times per day #	
		Calculated emission rate (mitigated), $\text{g}/\text{m}^2/\text{s}$	3.22E-05	

**Remark:**

# Please refer to Appendix 3-9 for calculation of dust suppression efficiency.

## Due to the phased construction area, only limited space and construction plants will be available for construction in any one time. Thus, the construction activities under the "Cut and Cover" category that would contribute to dust emissions will unlikely to operate at the same time. In fact, only one of the above activities will operate in any one time. However, to be conservative, air quality impacts due to simultaneous construction of these activities has been taken into account in the assessment.

\* The equation recommended for concerned particular construction activity as per Section 13.2.3 of USEPA AP-42 regarding heavy construction operation.

\*\* The concerned construction activity of this Project during site formation stage will involve earth movement activities and transportation of excavated/ fill materials, etc. The nature of these activities is similar to that of quarry operation. Thus, the typical silt loading within the range of typical values from quarry site, as stipulated in USEPA AP-42, Table 13.2.1-3, S13.2.1, 11/06 ed., is adopted in the above equation. The reported highest silt loading value has been used in this exercise for worst case scenario. It is noted that similar assumption has also been adopted for paved construction haul road in the approved EIA report, Appendix F of the "EIA-032/1999 - East Rail Extension Hung Hom to Tsim Sha Tsui - Environmental Impact Assessment".

\*\*\* Total site area of Phases B to D as well as buffer planting area along its edge in adjacent to the WRA, is taken as 4.4ha.

@ Based on conservative ratio reported in literature. Please refer to Appendix 3-10 for the justification.

***Annex 2***

**Remark:** \* The above results have included the background level extracted from the PATH Output (year 2015). The hour-by-hour background contribution is estimated using output of PATH model, and added hour-by-hour to the Project contribution in order to calculate the daily average total RSP levels.

\*\* Planned ASR within the planned "Yau Mei Site" Project, which is not applicable in this cumulative impact assessment.

**Annex 3-3 Summary Table of Cumulative Daily Average FSP Level (Mitigated Scenario)**

**Remark:** \* The above results have included the background level extracted from the PATH Output (year 2015). The hour-by-hour background contribution is estimated using output of PATH model, and added hour-by-hour to the Project contribution in order to calculate the daily average total RSP levels.

\*\* The FSP concentrations are calculated based on the predicted RSP concentrations by applying a FSP/RSP ratio of 0.3 according to the USEPA AP-42 reference document. Please refer to Appendix 3-10 for the justification of FSP/RSP ratio.

\*\*\* Planned ASR within the planned "Yau Mei Site" Project, which is not applicable in this cumulative impact assessment.

**Annex 3-4 Summary Table of Cumulative Maximum Annual Average RSP Level (Mitigated Scenario)**

<b>Max. RSP Level, ug/m3</b>						<b>43.7</b>	<b>0.4</b>		<b>44.4</b>	<b>1.1</b>		
<b>Relevant AQO Criteria, ug/m3</b>						<b>50</b>	<b>50</b>		<b>50</b>	<b>50</b>		
<b>Compliance with AQO?</b>						Yes	Yes		Yes	Yes		

**Remark:** \* The above results have included the background level extracted from the PATH Output (year 2015). The hour-by-hour background contribution is estimated using output of PATH model, and added hour-by-hour to the Project contribution in order to calculate the annual average total RSP levels.

\*\* Planned ASR within the planned "Yau Mei Site" Project, which is not applicable in this cumulative impact assessment.

<b>Max. FSP Level, ug/m<sup>3</sup></b>					<b>30.8</b>	<b>0.1</b>	<b>31.0</b>	<b>0.3</b>
<b>Relevant AQO Criteria, ug/m<sup>3</sup></b>					35	35	35	35
<b>Compliance with AQO?</b>					Yes	Yes	Yes	Yes

Remark: \* The above results have included the background level extracted from the PATH Output (year 2015). The hour-by-hour background contribution is estimated using output of PATH model, and added hour-by-hour to the Project contribution in order to calculate the annual average total FSP levels.

\*\* The FSP concentrations are calculated based on the predicted RSP concentrations by applying a FSP/RSP ratio of 0.3 according to the USEPA AP-42 reference document. Please refer to Appendix 3-10 for the justification of FSP/RSP ratio.

\*\*\* Planned ASR within the planned "Yau Mei Site" Project, which is not applicable in this cumulative impact assessment.
