## 1 Introduction

Muni Arborist Limited has been appointed by Ove Arup & Partners Hong Kong Ltd. to provide broad brush tree survey within development boundary in Yuen Long South. Trees with trunk diameter equal to or over 95mm at breast height (DBH) within the development boundary would be recorded. Approximate size, tree health and tree form etc. of the surveyed tree would be included in the Report. Detailed tree survey would be provided for the Potential Old and Valuable Trees (POVT) and Rare Species. Site inspections were conducted from 12<sup>th</sup> Jan to 8<sup>th</sup> Mar 2016. This Report summarizes the findings of the broad brush tree survey.

## 2 Methodology

### General Description and Assessment of Trees or Tree Groups:

Tree: Within the designated site boundary, all living trees (in some case large tree-form shrubs) with a main trunk over 95 mm in diameter at Breast Height (DBH) were included in the tree survey (AFCD Practice Note No. 2 / 2006). For potential Old and Valuable Tree (POVT) and rare tree species, tree was allocated and tagged with a tree number, and its position plotted on topographic plans. They were then identified to species, or in some case to genus if full identification was not possible. Measurements were taken of its trunk diameter, height and spread, with a photograph taken. The report includes the following information on each tree or tree group surveyed:

Tree Group: Within the designated site boundary, tree groups were identified for broad brush tree survey. The groups were demarcated by physical boundaries that separated different groups of trees. Examples of physical boundaries are roads, pedestrian walkway, fencing, nullah etc.

For inaccessible area (i.e. Group 5), no survey was conducted within the area.

### The Existing Individual Tree Assessment Schedule presents the following information:

- Tree no (numbers allocated to individual trees);
- Species<sup>1</sup> (Scientific name and Chinese common name);
- DBH (mm) at 1300 mm above ground level;
- Height (m);
- Crown spread (m);
- Health (Good/ Fair/ Poor);
- Form (Good/ Fair/ Poor);
- Survival Rate After Transplantation (High/ Medium/ Low); and
- Remarks (special features of particular tree).

DBH, height and crown spread were presented in ranges. POVT and rare tree species were measured individually.

<sup>1</sup> Where necessary, identification is verified / assisted by AFCD Hong Kong Herbarium and / or CUHK Herbarium.

Each tree or tree group was evaluated in terms of health and form and the justification was based on the followings:

**Health condition:** Each selected tree was evaluated in accordance with the following criteria and considerations:

### *Foliage*

- Evidence of “poor leaf colour and small leaf size [which] may indicate damage of roots” (Ref. R. Webb);
- Evidence of insect or fungal infections in leaves;
- Evidence of leaf damage owing to typhoons (although it is recognised that trees are usually able to recover from this within one growing season).

### *Twigs*

- Evidence of “poor shoot growth and die-back of twigs in the crown are often symptoms of root problems caused by a change in the water table level or soil compaction resulting from site development work” (Ref. R Webb);
- Evidence of insect and fungal infections on the twigs and branches;
- Evidence of twig damage particularly if the tree had been made unbalanced.

### *Branches*

- Dead or crossing branches;
- Evidence of “heavy horizontal branches [which] may make the tree unstable” (Ref. R.Webb);
- The presence of broken, damaged or cut branches as a possible site for infections;
- Evidence of damaged branches which may make the tree unbalanced or unstable;
- “an edge tree exposed as a result of the removal of adjacent trees often [which] has an unbalanced crown and may be hazardous” (Ref R.Webb).

### *Trunk*

- “Tightly forked trunks [which] are a source of weakness in the tree as in high winds the tree can be torn apart” (Ref R.Webb);
- Evidence of “cavities or internal rot [which] can be revealed by discoloured bark, moisture seeping through the bark or bracket fungi” (Ref R.Webb);
- Open cavities and bark damage.

### *Parasitism / Tangling*

- Occurrence of aggressive climbers, parasitic plants;
- Evidence of serious competition between closely located trees; tangling.

The health of each tree was graded in accordance with following:

**Good.** Trees with a low incidence of the less serious features and a medium chance of recovery can be graded **good**;

**Fair.** Trees with a higher incidence of the less serious features and a medium chance of recovery can be graded **fair**;

**Poor.** Trees with more serious health features and with a low chance of recovery, even with remedial measures, can be graded **poor**.

**Tree Form:** Tree form is graded in accordance with the following:

**Good.** Trees with well-balanced form, upright, evenly branching, well-formed head and generally in accordance with the standard form for its species can be graded **good**;

**Fair.** Trees with generally balanced form with natural compensations for loss of branches or leaning trunks for example can be graded **fair**;

**Poor.** Trees with very unbalanced form, leaning, suffering loss of major branches with general damage and growing close to adjacent trees can be graded **poor**.

**Survival Rate After Transplantation:** In order to be considered successfully transplanted, a tree must maintain good health throughout and after the transplantation process AND must at no time be structurally unstable or present any threat to public safety. The assessment of the survival rate after transplanting a tree is based on the following factors:

- The health of the tree: If the tree is already in poor health it is highly unlikely to withstand the stress of transplantation. By the same token, a tree that has a balanced form and is in good health has a higher feasibility of successful transplantation;
- Site conditions: Survival rate of trees will depend on feasibility of formation of sufficient rootball, location of the tree (whether the tree located on slope or grows on rocks) etc.
- The survival rate of that particular species: Some species are much more tolerant of the stress of transplantation than others. The assessment of the survival rate of a species after transplantation based on the observed performance of that species in previous transplantation programs. Species with insufficient transplantation data are assumed to have a low survival rate.

### 3 General Descriptions of the Surveyed Trees

The surveyed area was demarcated into 5 phases and 19 tree groups. Please refer to Appendix I for the location of each Phase and the demarcation of different tree groups. Approximate 17421 trees were identified with approximate 170 different tree species. 35 trees were rare species (*Aquilaria sinensis* and *Artocarpus hypargyreus*) and 42 trees were POVT. The dominant tree species were *Acacia confusa*, *Leucaena leucocephala*, *Ficus microcarpa*, *Macaranga tanarius* var. *tomentosa*, and *Bauhinia* spp.. The general tree information was recorded in Tree Schedule as enclosed in Appendix II. Tree group photos are provided in Appendix III. For the location and details of POVT and rare species, please refer to Appendix IV, V and VI respectively.

Table 1: Summary table of the surveyed trees in Tree Group 1

Phase	Tree Group	Botanical Name	Chinese Common Name	Approx. Number of Trees
1	1	<i>Broussonetia papyrifera</i>	槽樹	25
		<i>Dimocarpus longan</i>	龍眼	20
		<i>Morus alba</i>	桑	12
		<i>Macaranga tanarius</i> var. <i>tomentosa</i>	血桐	7
		<i>Celtis sinensis</i>	朴樹	5
		<i>Litsea monopetala</i>	假柿木薑子	5
		<i>Mangifera indica</i>	芒果	5
		<i>Clausena lansium</i>	黃皮	4
		<i>Carica papaya</i>	番木瓜	3
		<i>Litchi chinensis</i>	荔枝	3
		<i>Leucaena leucocephala</i>	銀合歡	2
		<i>Melia azedarach</i>	苦楝	2
		<i>Michelia x alba</i>	白蘭	2
		<i>Plumeria rubra</i>	雞蛋花	2
		<i>Araucaria heterophylla</i>	異葉南洋杉	1
		<i>Artocarpus heterophyllus</i>	菠蘿蜜	1
		<i>Averrhoa carambola</i>	楊桃	1
		<i>Bauhinia</i> spp.	羊蹄甲屬	1
		<i>Bridelia tomentosa</i>	土蜜樹	1
		<i>Lagerstroemia speciosa</i>	大花紫薇	1
		<i>Litsea glutinosa</i>	潺槁樹	1
		<i>Nageia nagi</i>	竹柏	1
<i>Platycladus orientalis</i>	側柏	1		
<i>Psidium guajava</i>	番石榴	1		
<i>Trema tomentosa</i>	山黃麻	1		
Sub total				108

Table 2: Summary table of the surveyed trees in Tree Group 2

Phase	Tree Group	Botanical Name	Chinese Common Name	Approx. Number of Trees
2	2	<i>Lophostemon confertus</i>	紅膠木	278
		<i>Pinus massoniana</i>	馬尾松	193
		<i>Acacia confusa</i>	台灣相思	186
		<i>Pinus elliotii</i>	濕地松(愛氏松)	49
		<i>Schefflera heptaphylla</i>	鵝掌柴(鴨腳木)	43
		Dead tree	死樹	19
		<i>Castanopsis fissa</i>	蠟菊錐(裂斗錐栗)	5
		<i>Aquilaria sinensis</i>	土沉香(牙香樹)	3
		<i>Litsea glutinosa</i>	潺槁樹	3
		<i>Macaranga tanarius</i> var. <i>tomentosa</i>	血桐	3
		<i>Sapium discolor</i>	山烏柏	2
		<i>Cinnamomum camphora</i>	樟	1
		<i>Pandanus tectorius</i>	露兜樹	1
		<i>Rhodomyrtus tomentosa</i>	崗稔	1
		<i>Rhus succedanea</i>	木蠟樹(野漆樹)	1
		<i>Trema tomentosa</i>	山黃麻	1
		Sub total		

Table 3: Summary table of the surveyed trees in Tree Group 3

Phase	Tree Group	Botanical Name	Chinese Common Name	Approx. Number of Trees		
3	3	<i>Dimocarpus longan</i>	龍眼	31		
		<i>Clausena lansium</i>	黃皮	24		
		<i>Leucaena leucocephala</i>	銀合歡	21		
		<i>Glochidion zeylanicum</i>	香港算盤子	14		
		<i>Macaranga tanarius</i> var. <i>tomentosa</i>	血桐	13		
		<i>Mangifera indica</i>	芒果	8		
		<i>Carica papaya</i>	番木瓜	5		
		<i>Celtis sinensis</i>	朴樹	4		
		<i>Litchi chinensis</i>	荔枝	4		
		Dead Tree	死樹	4
