1. Introduction

To protect the marine environment of Hong Kong for various beneficial and sustainable uses, the Environmental Protection Department (EPD) has been implementing a comprehensive marine water quality monitoring programme since 1986. The aims and objectives of the programme are to:

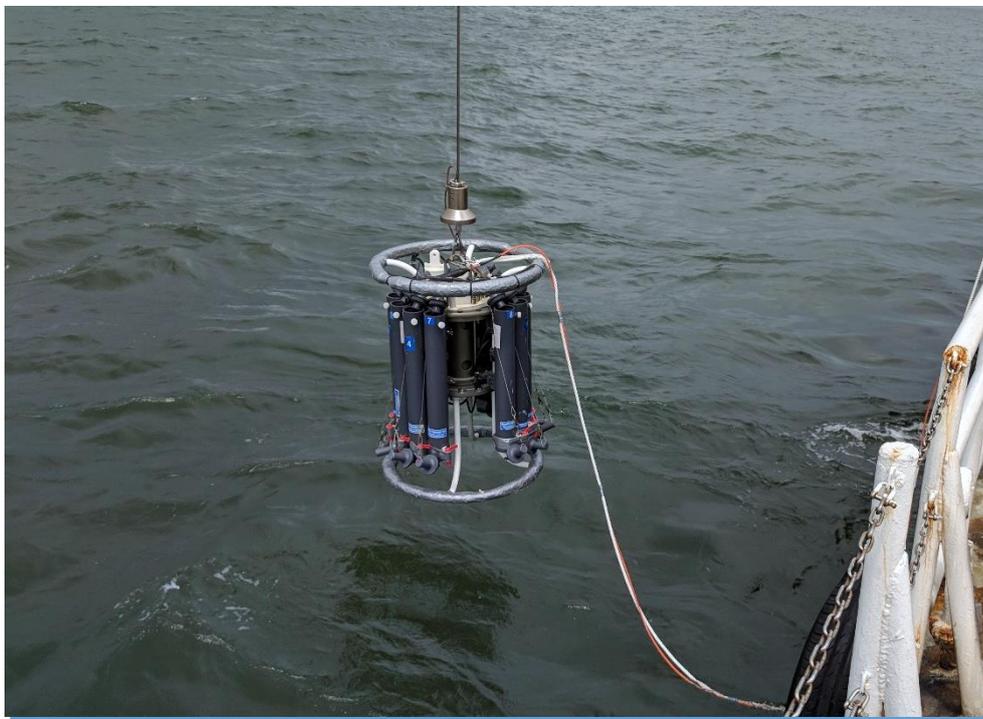

- evaluate the health state of marine waters;
- monitor long-term changes in water quality;
- provide a scientific basis for planning water pollution control strategies and evaluating their effectiveness; and
- assess the compliance with statutory Water Quality Objectives (WQOs).

On a monthly basis, the EPD monitors the marine water quality at 76 monitoring stations in open waters, and collects and examines phytoplankton samples from 26 of these stations. We also monitor, at bimonthly intervals, the water quality of 18 monitoring stations located in sheltered waters, including 14 typhoon shelters, three sheltered anchorages and the Government Dockyard. In addition, sediment samples are collected twice a year from 60 monitoring stations for analyses, including 45 stations in open waters and 15 stations in sheltered waters.

EPD's marine monitoring vessel "Dr. Catherine Lam"

Most of the field work at these monitoring stations is conducted on board of *MV Dr. Catherine Lam* – EPD’s marine monitoring vessel. An advanced conductivity-temperature-depth (CTD) profiler linked to a computer-controlled rosette water sampler is set up on the vessel to allow simultaneous depth profiling of *in situ* measurements and water sampling at specified depths. Marine sediments are collected by using a Van Veen sediment grab sampler. The water and sediment samples are analysed by the Government Laboratory and EPD’s in-house laboratory for over 80 physical, chemical and biological parameters. Details of the water quality and sediment parameters, their analytical methods as well as information of monitoring stations and WQOs are given in Appendix A.

2. The State of Hong Kong Marine Waters in 2021

2.1 Overall Compliance Rate of Marine Water Quality Objectives (WQOs)

The overall marine WQO compliance rate¹ for Hong Kong was 90% in 2021 (see Figure 1). The compliance rates for the four key WQO parameters and the overall WQO compliance rates for the ten water control zones (WCZs) are shown in Figures 2 and 3. Notably, full compliance with the *Escherichia coli* (*E. coli*) and Unionised Ammonia Nitrogen (NH₃-N) WQOs in all applicable WCZs have been achieved for seven consecutive years since 2015. The compliance rates of the Dissolved Oxygen (DO) and Total Inorganic Nitrogen (TIN) WQOs were 95% and 72% respectively in 2021.

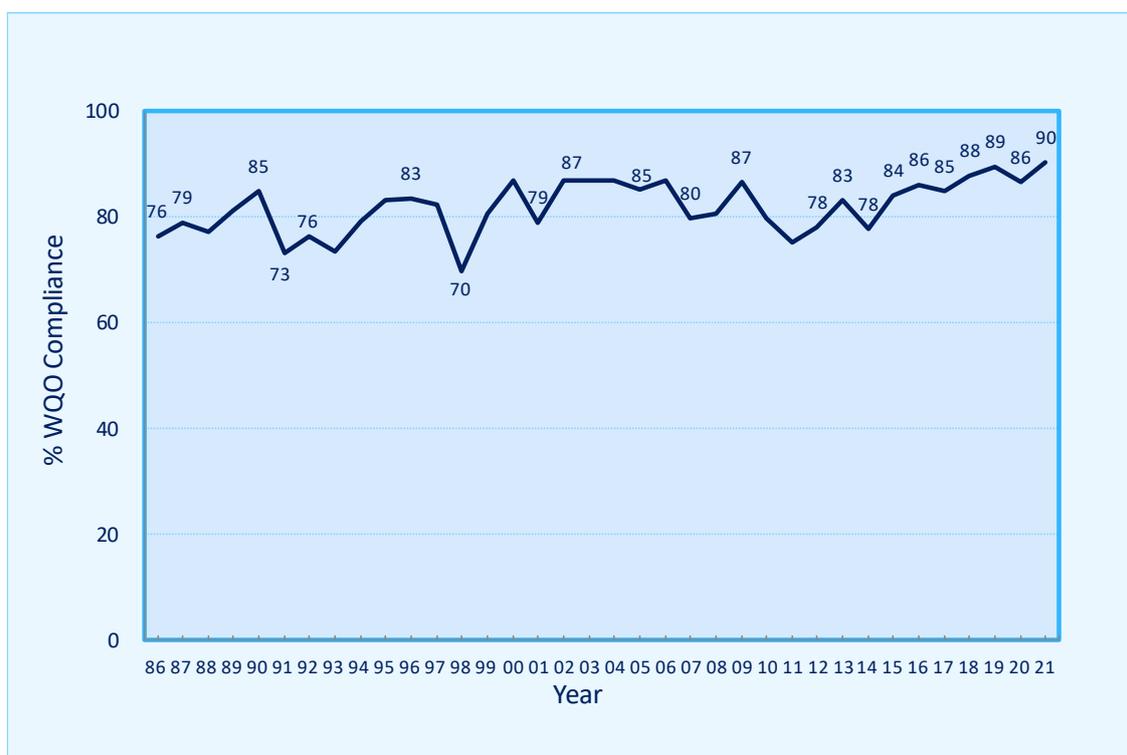

Figure 1. Overall marine WQO compliance rates, 1986-2021

For the DO WQO, localised non-compliance was observed in the Tolo Harbour and Channel WCZ and the Deep Bay WCZ. For the TIN WQO, non-compliance was observed in waters with a background level of TIN that has been consistently higher than other waters, covering the Deep Bay WCZ, North Western WCZ and Southern WCZ. The WQO compliance status of individual WCZs are presented in Chapter 3, with details of water quality monitoring data and compliance status of individual monitoring stations presented in Appendices B and C respectively.

¹ The overall marine WQO compliance rate for Hong Kong's marine waters is calculated based on the overall average of the compliance rates for all monitoring stations for the four key marine WQO parameters including DO, TIN, NH₃-N and *E. coli*.

2.2 Highlight in 2021 – Water Quality of Victoria Harbour

The vibrant Victoria Harbour, where more than half of Hong Kong's population reside, has seen significant improvement in its water quality upon staged implementation of the Harbour Area Treatment Scheme (HATS) in the last 20 years. As illustrated in Figure 4, over the recent six years, the average annual levels of *E. coli* and NH₃-N have significantly decreased to 361 counts per 100mL and 0.004 mg/L respectively, while that of DO has maintained at 5.5 mg/L.

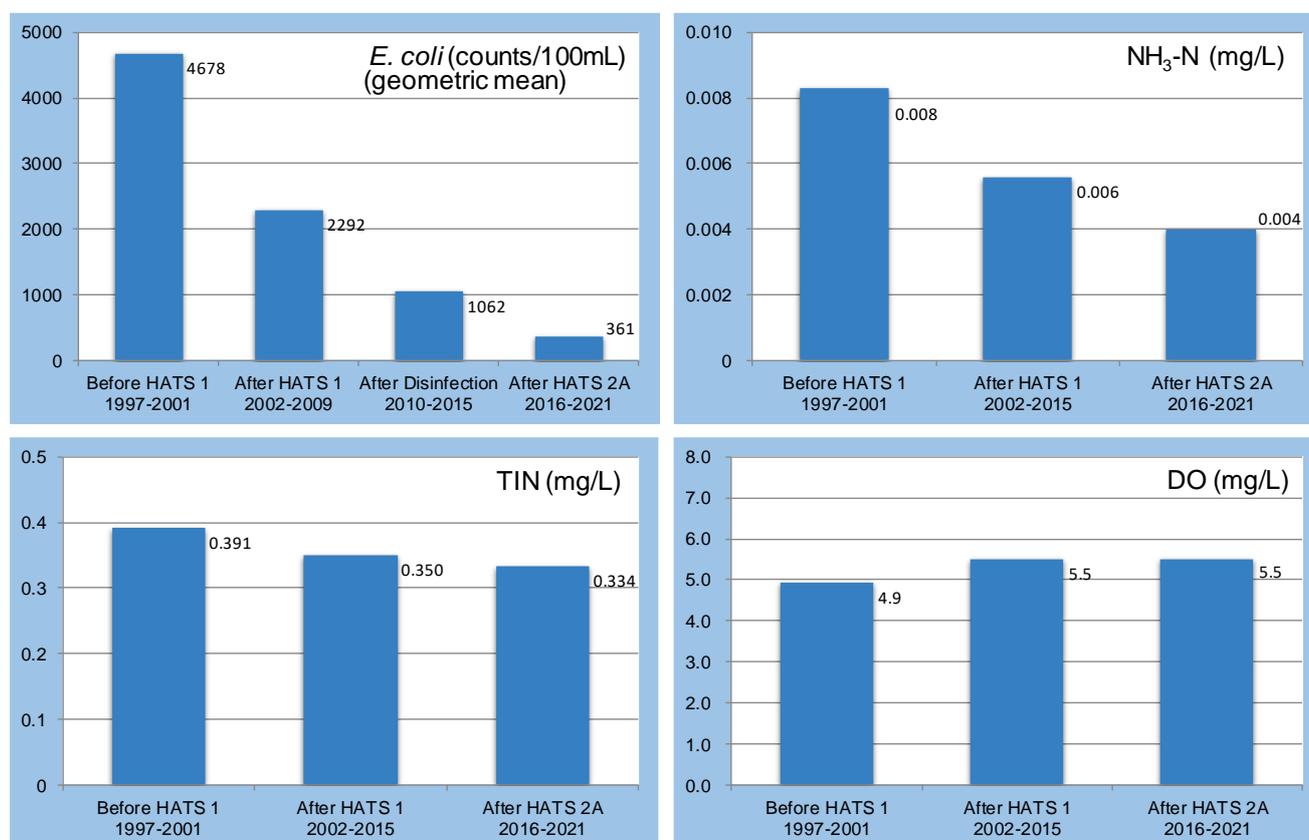

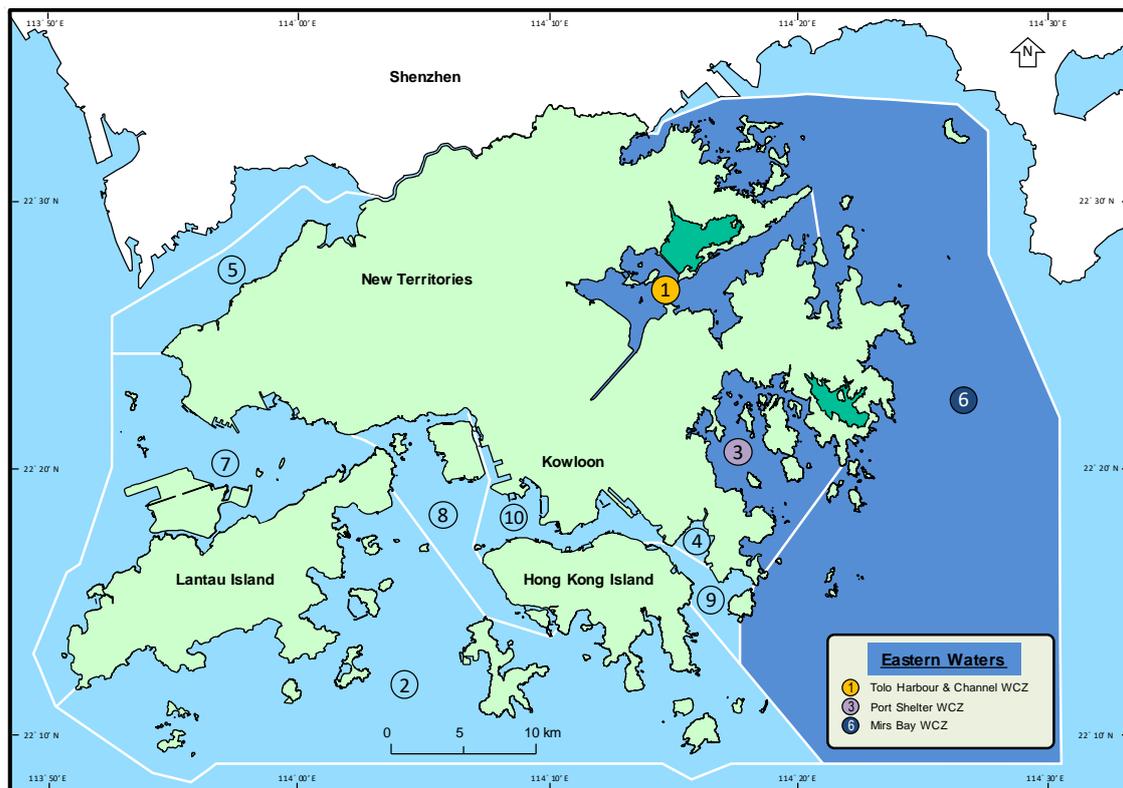

Figure 4. Water quality improvement in Victoria Harbour after the phased implementation of Harbour Area Treatment Scheme (HATS) since 2001

3. Water Quality of the Ten Water Control Zones (WCZs)

Based on the hydrographical conditions of Hong Kong waters and the proximity to the Pearl River Estuary, the ten WCZs are grouped into four main areas: namely Eastern, Central, Western and Southern Waters. Details of their respective water quality conditions are reported in the following sections.

3.1 Eastern Waters

The eastern waters comprise three WCZs: namely the Mirs Bay WCZ, the Port Shelter WCZ and the Tolo Harbour and Channel WCZ. These waterbodies cover six gazetted bathing beaches, three marine parks, the Hong Kong Geopark, 20 fish culture zones and beautiful natural coastlines with pristine water quality supporting a diversified array of marine life, fisheries and recreation activities.

Mirs Bay Water Control Zone

In 2021, the Mirs Bay WCZ fully achieved the marine WQOs. The water quality was very good with high DO, and low nutrient and *E. coli* levels, fitting secondary contact recreational uses. Figures 5 and 6 illustrate the WQO compliance rates and some long-term water quality trends for the Mirs Bay WCZ in the past three decades.

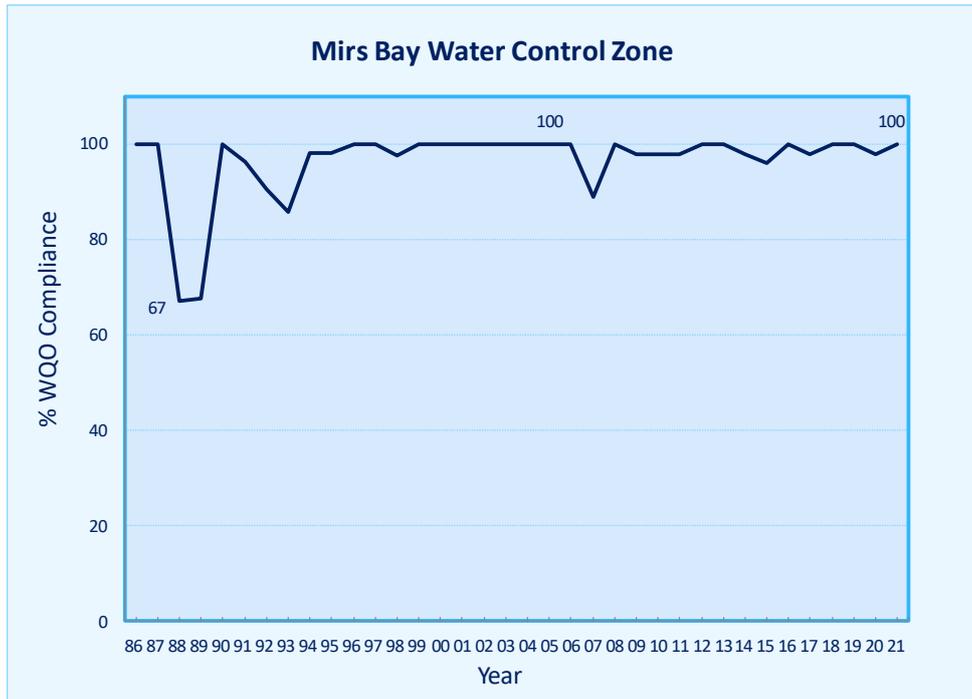

Figure 5. Overall WQO compliance rate for the Mirs Bay WCZ, 1986-2021

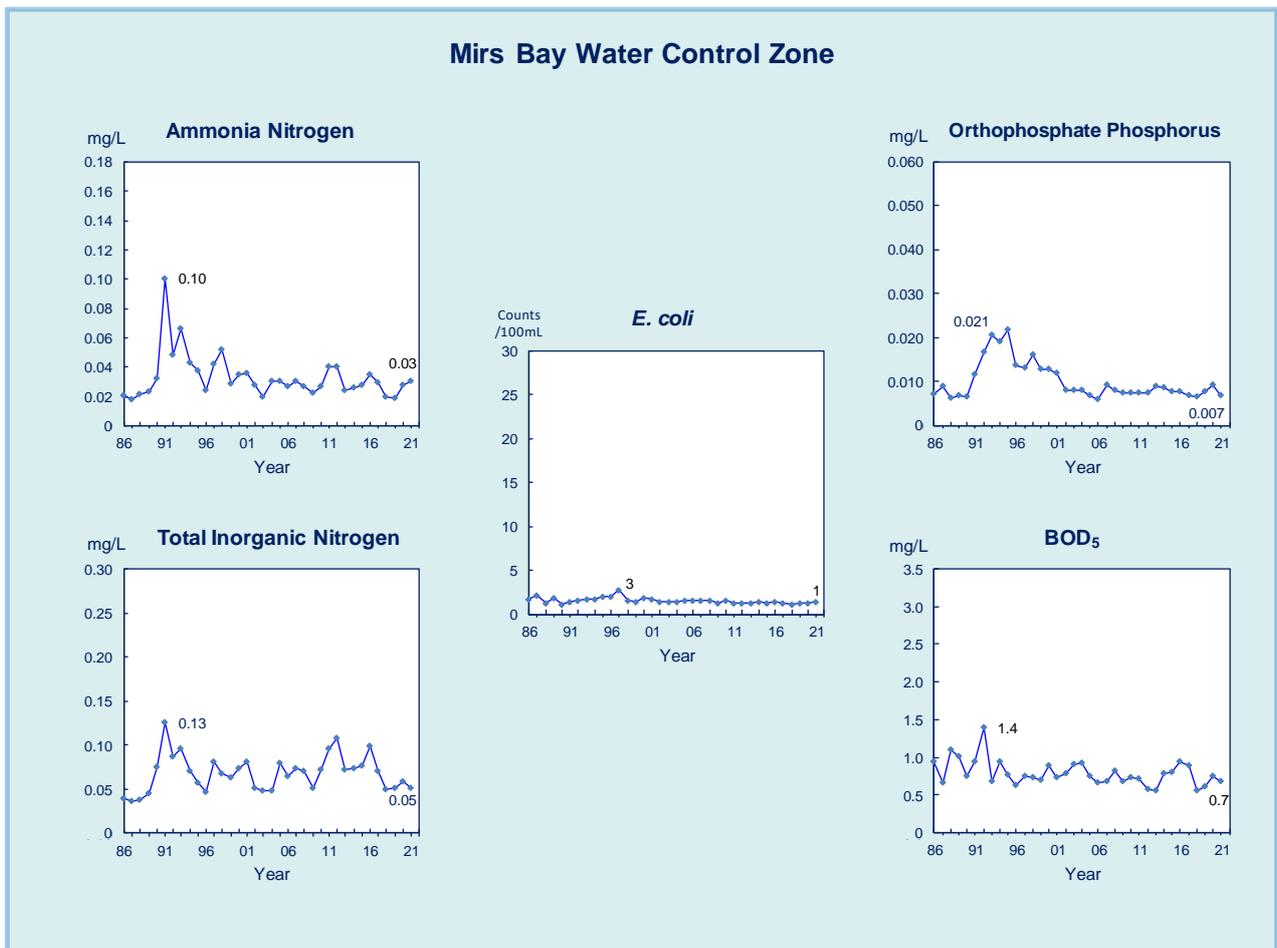

Figure 6. Long-term water quality trends in the Mirs Bay WCZ, 1986-2021

Port Shelter Water Control Zone

In 2021, the water quality of the Port Shelter WCZ remained excellent, fully achieving the WQOs for seven consecutive years since 2015.

The WQO compliance rates and long-term water quality trends for the Port Shelter WCZ since 1986 are illustrated in Figures 7 and 8. In addition to the generally low pollution levels, there was also a steady decrease in nutrients concentrations (including ammonia nitrogen ($\text{NH}_4\text{-N}$) and orthophosphate phosphorus ($\text{PO}_4\text{-P}$)).

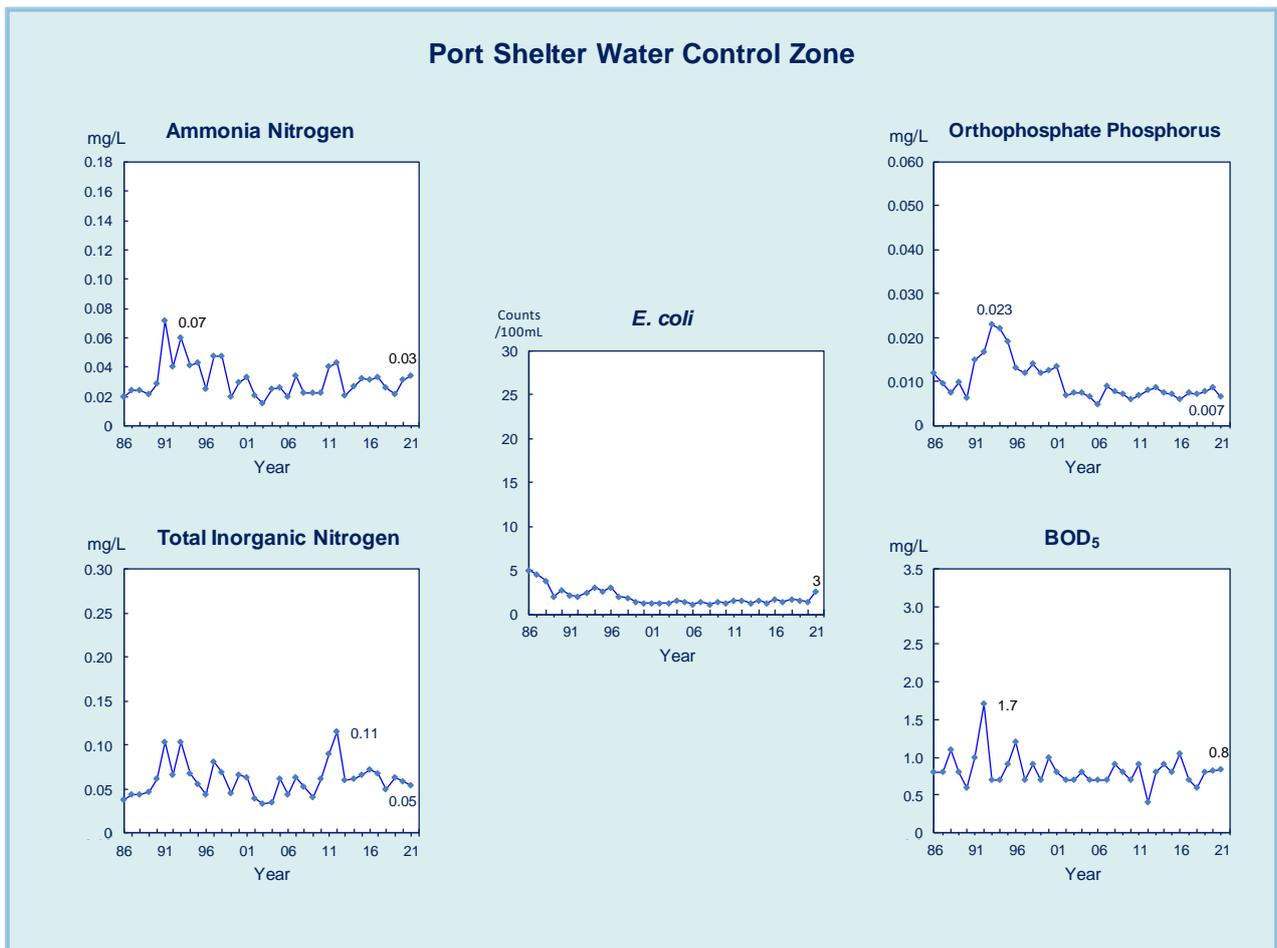

Figure 8. Long-term water quality trends in the Port Shelter WCZ, 1986-2021

Tolo Harbour and Channel Water Control Zone

The overall marine WQO compliance rate for the Tolo Harbour and Channel WCZ was 79% in 2021. The Tolo Harbour and Channel WCZ consistently complied with the bacteriological WQO for secondary contact recreational uses. This embayment of water is, however, subject to a natural hydrological phenomenon of water column stratification and associated formation of bottom layer water masses with low DO level in summer period due to restricted water exchange with the open waters.

Upon the implementation of the Tolo Harbour Action Plan since the mid-1980s, there has been a marked improvement in the water quality in Tolo Harbour in the past three decades, as shown in Figures 9 and 10.

3.2 Central Waters

The central waters of Hong Kong are important port areas and navigational channels covering four WCZs, i.e. the Victoria Harbour WCZ, the Eastern Buffer WCZ, the Western Buffer WCZ and the Junk Bay WCZ.

Victoria Harbour Water Control Zone

The Victoria Harbour WCZ achieved an overall WQO compliance rate of 100% in 2021.

As shown in Figure 11, the *E. coli* level in the eastern side of Victoria Harbour has decreased markedly since the implementation of HATS Stage 1 in 2001. The annual Cross Harbour Swim, suspended since 1979 because of poor water quality, was resumed on the eastern side of the harbour in 2011 after implementation of the HATS ADF. With full commissioning of the HATS Stage 2A, the *E. coli* level of the central harbour area has been further reduced. Since 2017, the race route of the event has returned to the traditional route in the central harbour area.

Figures 12 and 13 show the WQO compliance rates and some long-term water quality trends for the Victoria Harbour WCZ in the period of 1986 to 2021.

Eastern Buffer Water Control Zone and Junk Bay Water Control Zone

Both the Eastern Buffer WCZ and the Junk Bay WCZ have fully achieved the marine WQOs for the past 22 years. Since the implementation of the HATS Stage 1 in 2001, the water quality of these two WCZs has improved noticeably with significant increase in DO level and decrease in nutrient and bacteria levels.

Western Buffer Water Control Zone

The Western Buffer WCZ fully achieved the WQOs in 2021. Since the commissioning of the HATS ADF in 2010, the *E. coli* level in the WCZ decreased substantially.

Kap Shui Mun Bridge linking Ma Wan and Lantau Island

Figures 18 and 19 illustrate the WQO compliance rate and some long-term water quality trends for the Western Buffer WCZ since 1986. Similar to other WCZs in the central waters, significant improvement of water quality as reflected in reduction in levels of *E. coli* and PO₄-P has been observed.

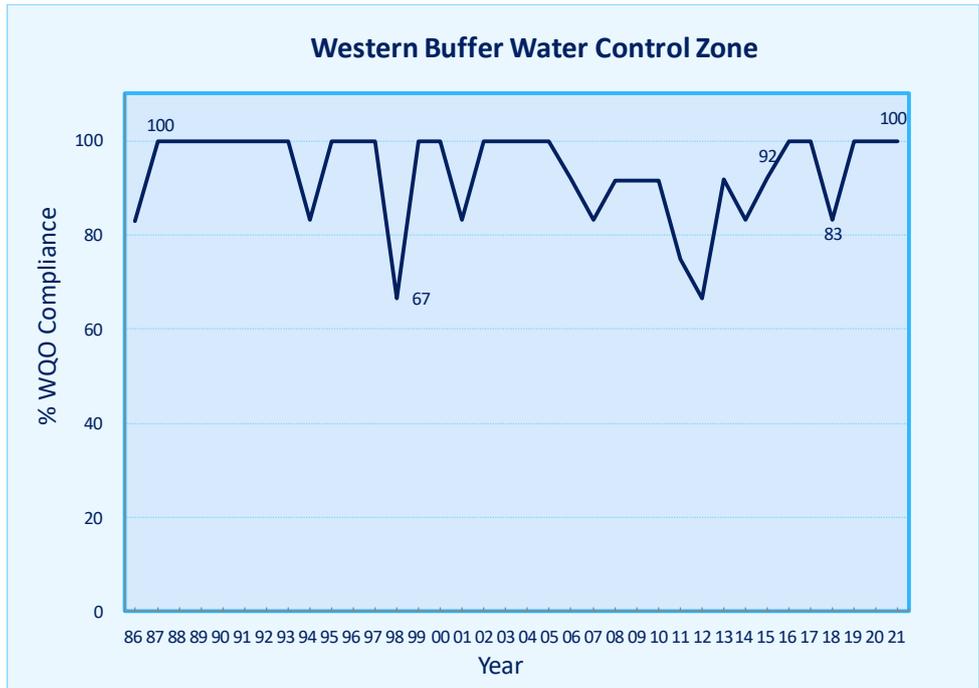

Figure 18. Overall WQO compliance rate for the Western Buffer WCZ, 1986-2021

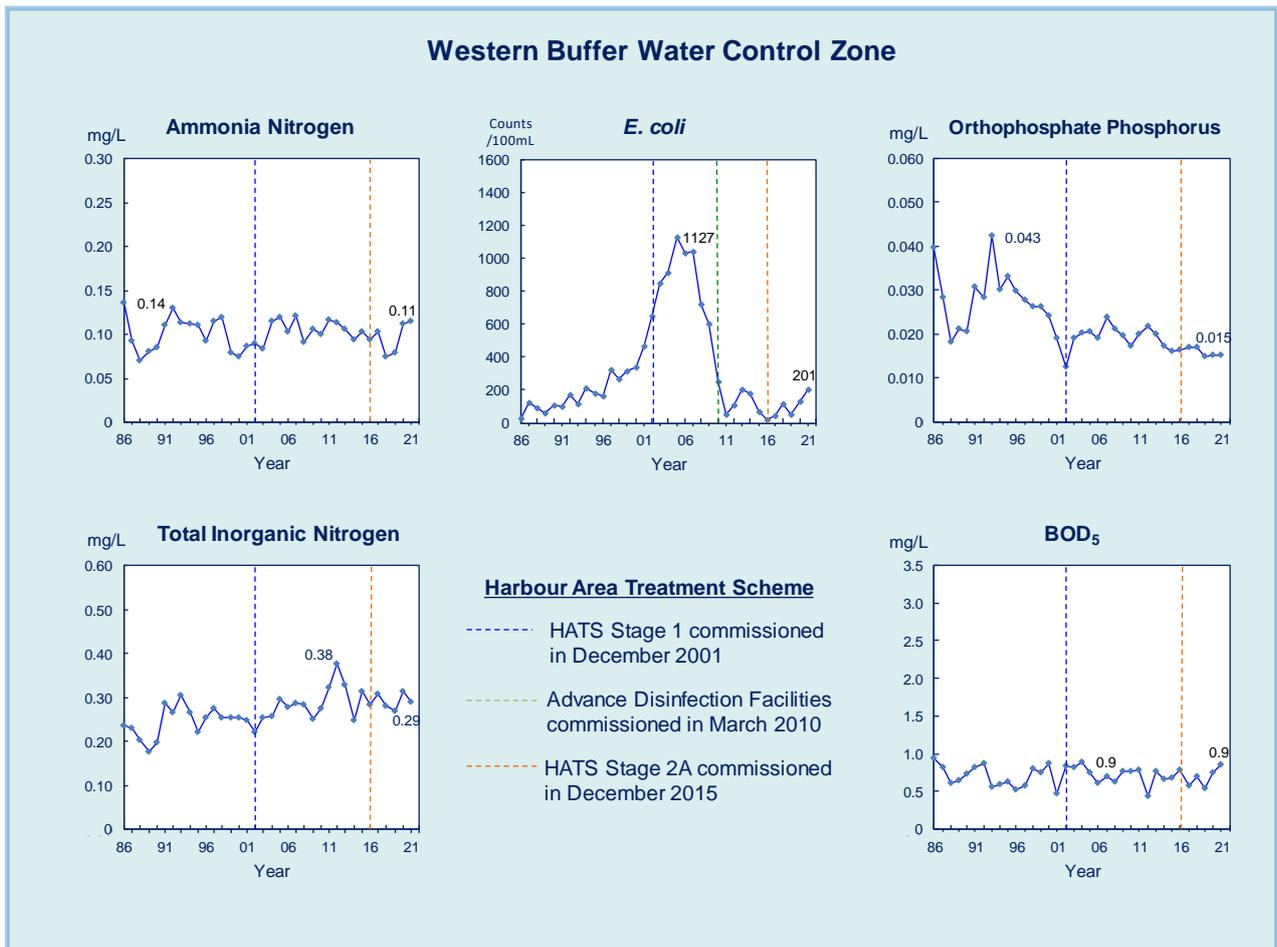

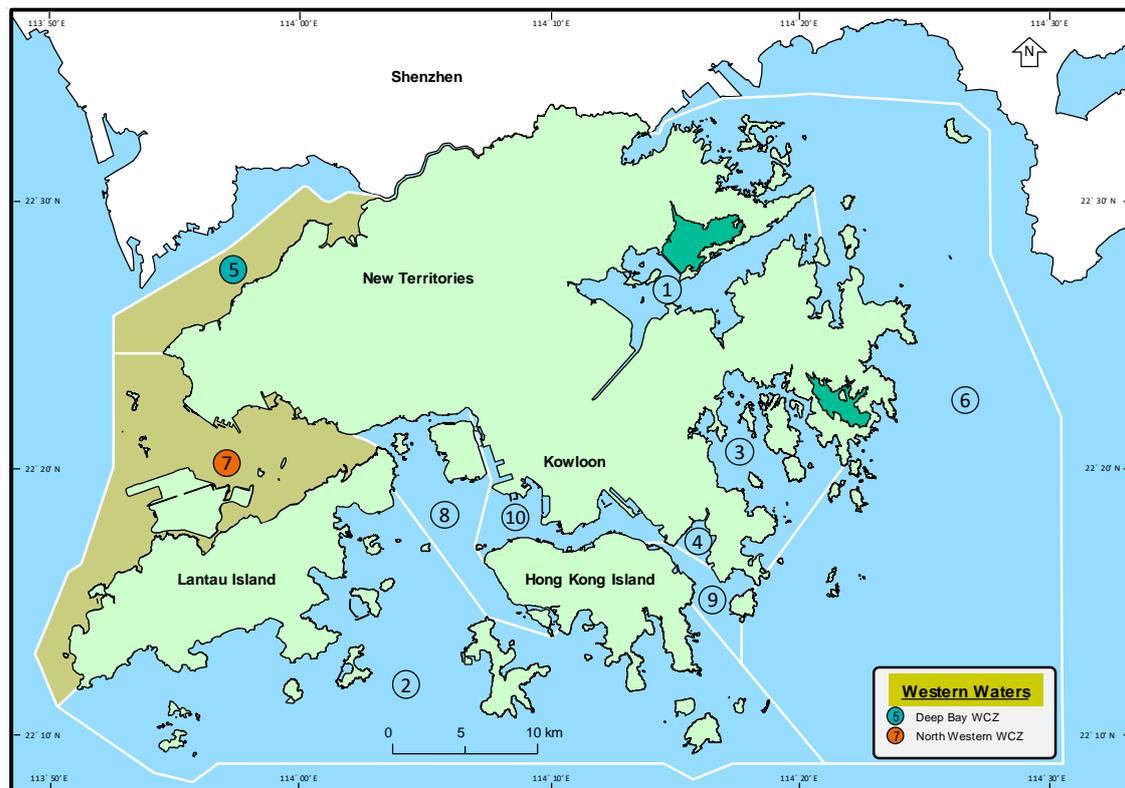

Figure 19. Long-term water quality trends in the Western Buffer WCZ, 1986-2021

3.3 Western Waters

The Deep Bay WCZ and the North Western WCZ are located in the western part of Hong Kong. The former includes the ecologically sensitive Mai Po Inner Deep Bay Ramsar Site and areas of oyster culture. The latter covers the waters around the North and Western side of Lantau Island, Tuen Mun, Sha Chau and Lung Kwu Chau.

Deep Bay Water Control Zone

In 2021, the overall WQO compliance rate for the Deep Bay WCZ was 60%, as compared with a ten-year average of 47% in 2009-2018. Overall, with the measures under the Deep Bay Water Pollution Control Joint Implementation Programme taken progressively by the governments of Hong Kong and Shenzhen, there have been significant water quality improvements in Deep Bay. In particular, there has been full compliance of the $\text{NH}_3\text{-N}$ WQOs in the past seven years. Although Deep Bay, as compared with other WCZs, shows higher nutrient levels with annual depth-averaged TIN levels exceeding the respective TIN WQOs, a noticeable long-term decrease in TIN levels since mid-2000s has been seen. The improvement in the WQO compliance rates and long-term water quality trends for Deep Bay since mid-2000s are illustrated in Figures 20 to 22.

North Western Water Control Zone

In 2021, the overall WQO compliance rate of the North Western WCZ was 89%, with the DO and NH₃-N WQOs fully met. Under the influence of high background level in the Pearl River Estuary, the compliance rate for TIN WQO was 67%. The WQO compliance rate and long-term water quality trends for the North Western Water WCZ are illustrated in Figures 23 and 24.

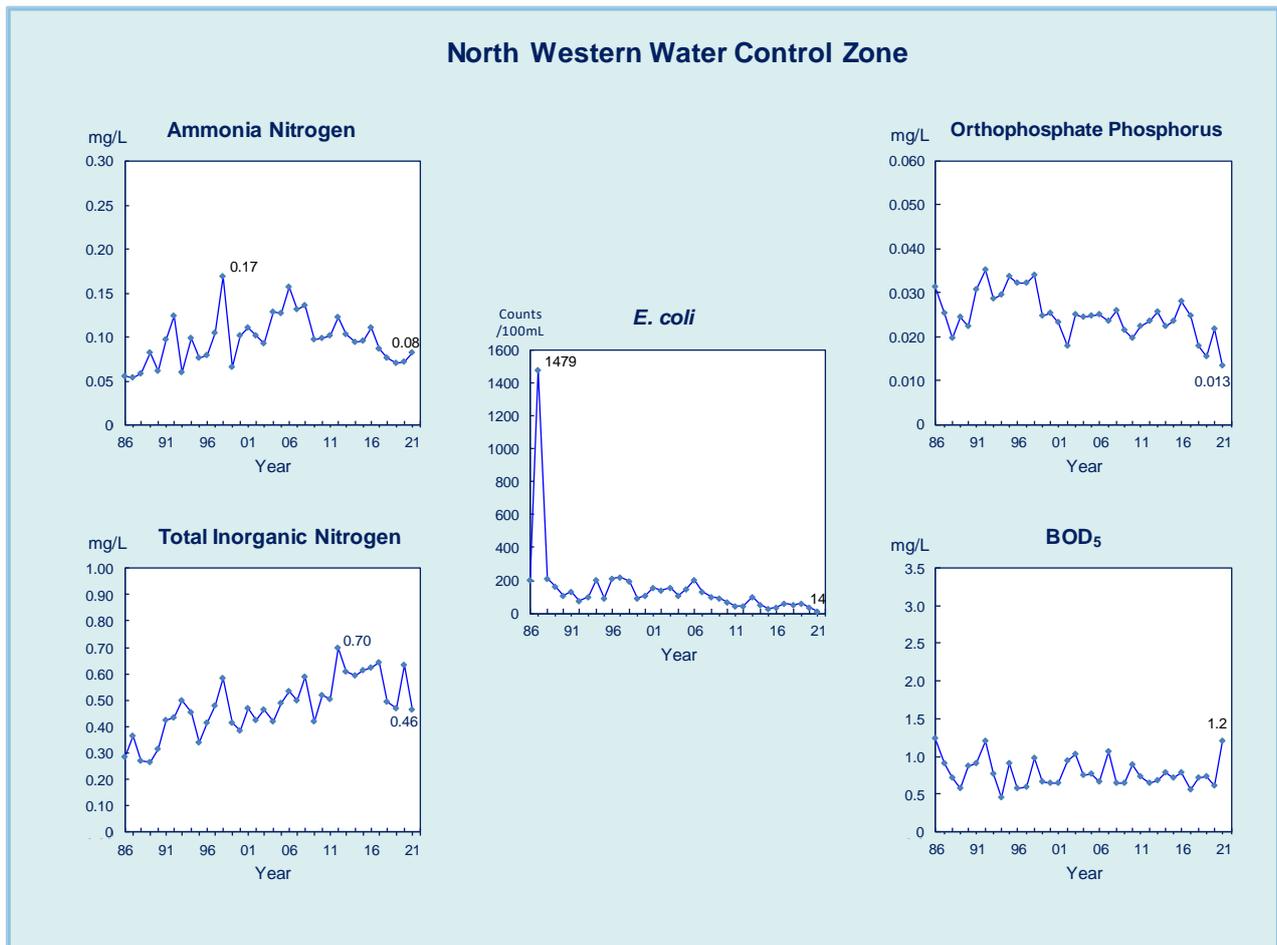

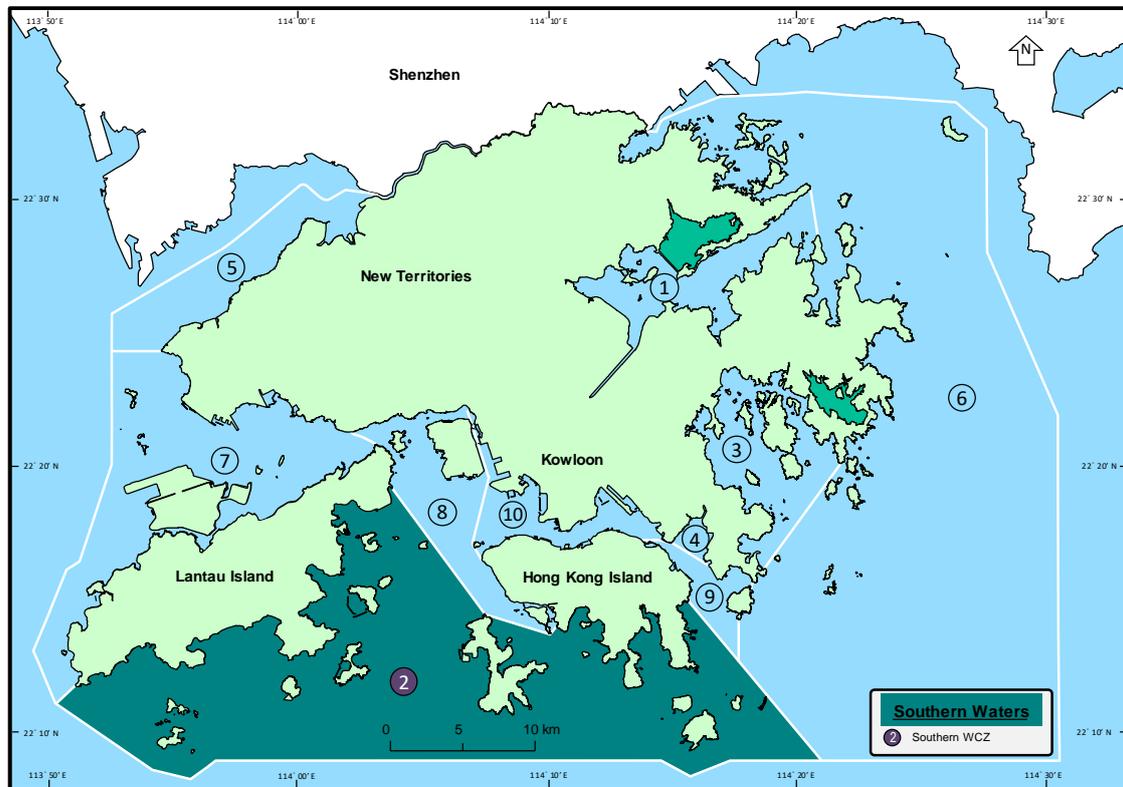

Figure 24. Long-term water quality trends in the North Western WCZ, 1986-2021

3.4 Southern Waters

The southern waters cover the Southern WCZ, stretching from south of Hong Kong Island to Lantau Island. This water body covers 21 gazetted beaches, one marine park, one marine reserve and four fish culture zones.

Southern Water Control Zone

In 2021, the Southern WCZ achieved an overall WQO compliance rate of 77%, with full attainment of the DO and NH₃-N WQOs. While the TIN level in the southern waters was generally lower than the adjacent western and central waters, it could not meet the more stringent TIN WQO of the WCZ.

Cape D'Aguilar Marine Reserve in the Southern WCZ

The Southern WCZ also covers a number of secondary contact recreation subzones mainly located along the southern coast of Hong Kong Island and the outlying islands. In 2021, full compliance with the bacteriological WQO on *E. coli* for all these secondary contact recreation subzones was achieved. The WQO compliance rates and long-term water quality trends for the Southern WCZ are plotted in Figures 25 and 26.

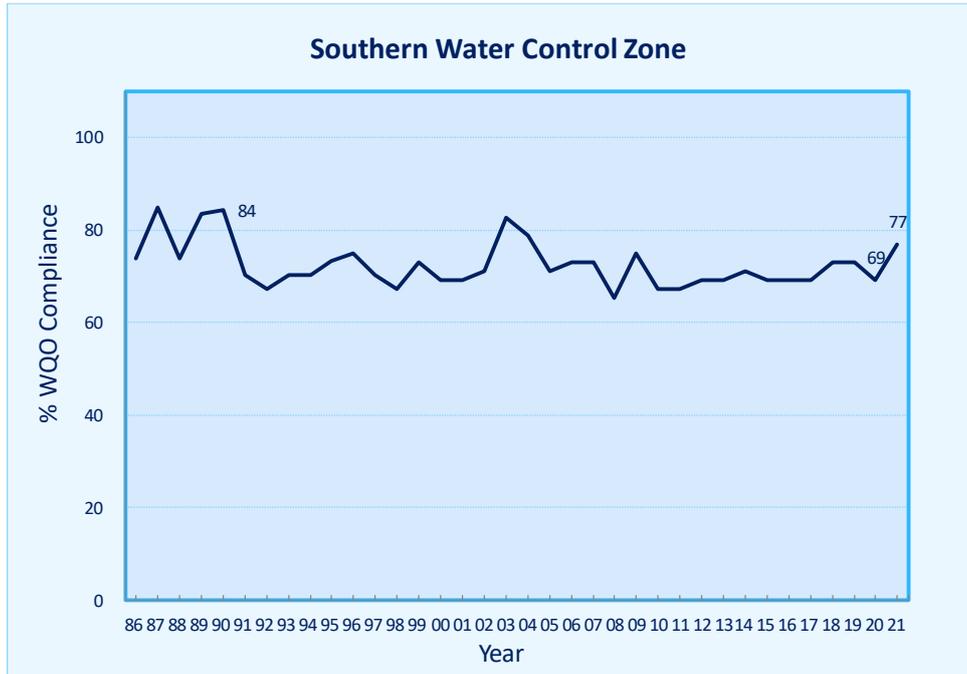

Figure 25. Overall WQO compliance rate for the Southern WCZ, 1986-2021

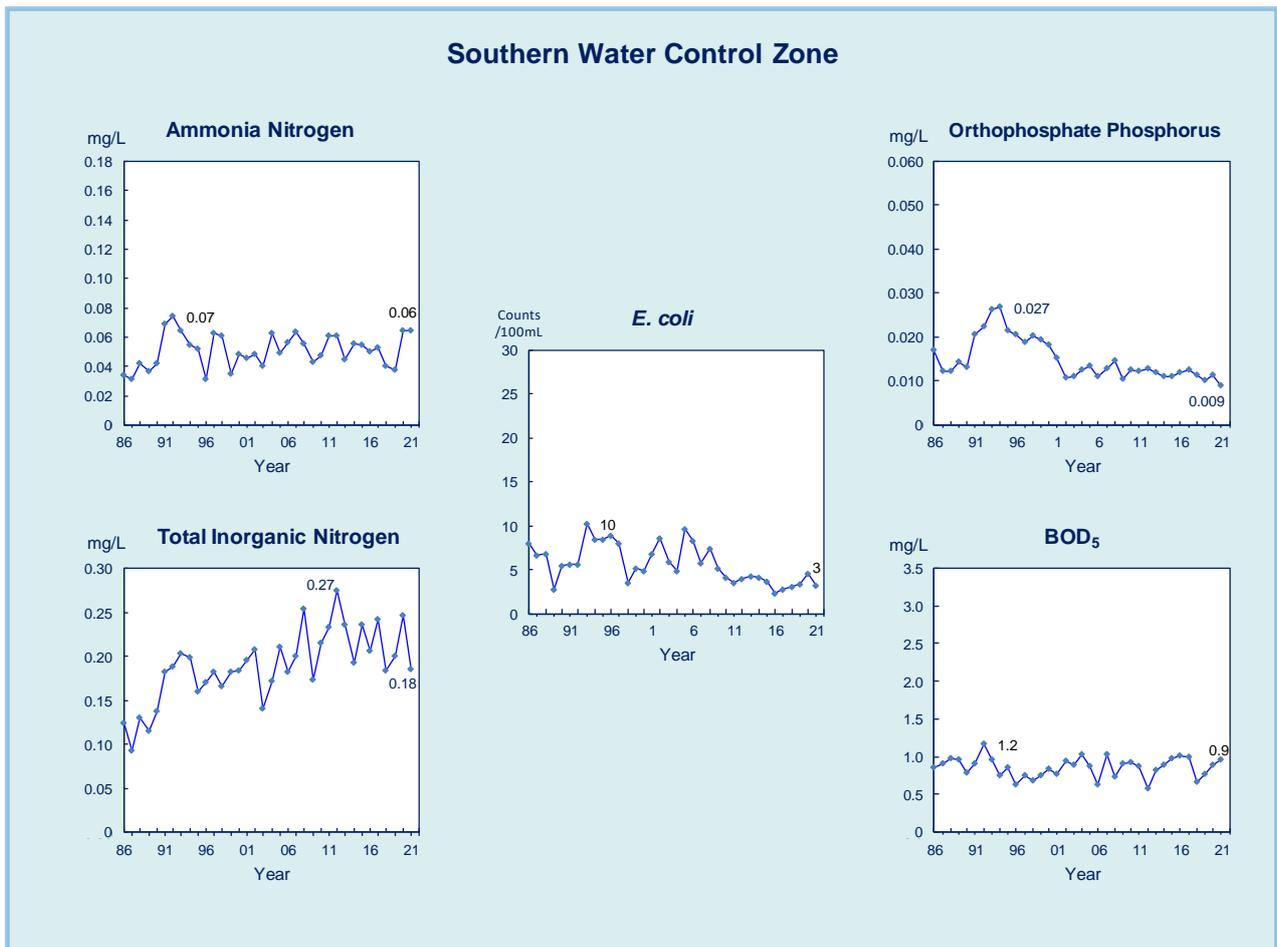

Figure 26. Long-term water quality trends in the Southern WCZ, 1986-2021

4. Marine Sediment Quality

Sediment samples taken in different parts of Hong Kong were analysed for over 60 physical, chemical and biological parameters. Details of sediment quality in all WCZs in the last five years (2017-2021) are summarised in Appendix E.

5. Typhoon Shelters

The EPD monitored the water quality of 14 typhoon shelters, three sheltered anchorages and the Government Dockyard. Some of these typhoon shelters (e.g. Causeway Bay Typhoon Shelter and Kwun Tong Typhoon Shelter) are located adjacent to densely populated residential, commercial and/or industrial areas. Others (e.g. Cheung Chau Typhoon Shelter and Shuen Wan Typhoon Shelter) are located in outlying islands or relatively away from urban areas. There is no bacteriological WQO set for typhoon shelters which are used only for vessel mooring. In 2021, the NH₃-N levels recorded in all typhoon shelters were generally low, and well within the NH₃-N WQOs set for respective WCZs.

Overall, the water quality of the typhoon shelters in Hong Kong has been improving over the last decade. Figure 27 shows the long-term improving trend in the depth-averaged DO level in the Kwun Tong Typhoon Shelter.

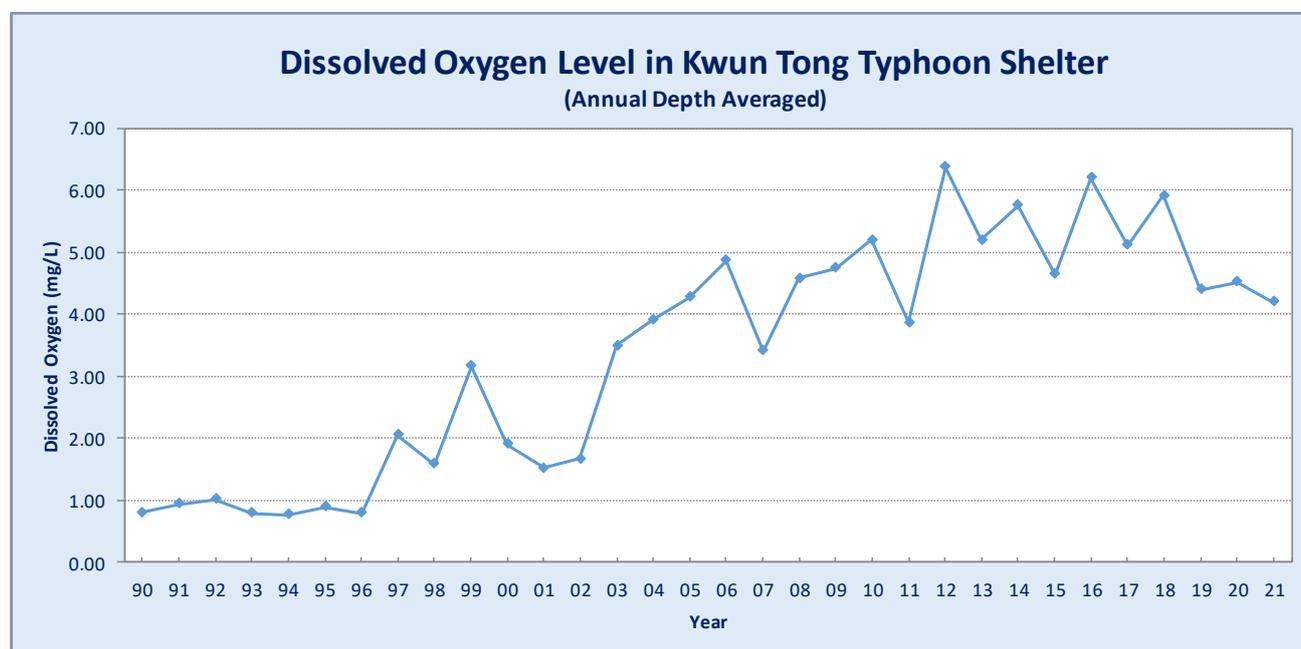

Figure 27. Long-term improvement in dissolved oxygen level in the Kwun Tong Typhoon Shelter, 1990-2021

6. Phytoplankton and Red Tides

The EPD conducts monthly sampling of phytoplankton at 26 marine water quality monitoring stations¹ to determine the long-term changes and trends in their composition and densities in Hong Kong marine waters. In 2021, a total of 96 phytoplankton species were recorded in Hong Kong waters, on par with a five-year average of 94 phytoplankton species in 2016-2020. Of these, 54 species were diatoms (56%), 30 were dinoflagellates (31%) and 12 were from other minor algal groups² (13%). This phytoplankton composition profile was generally similar to those observed in the past five years. Of the samples examined in 2021, diatoms were the dominant group found in our coastal waters in terms of species richness (number of species identified). Diatoms were also the dominant group in terms of cell density, except Deep Bay. The unusually high annual percentage of dinoflagellates recorded in Deep Bay in 2021 was due to a month-long red tide event that occurred in March to May 2021³.

The total phytoplankton densities were generally higher at the monitoring stations in the Tolo Harbour and Channel WCZ. The densities of diatoms, dinoflagellates and other minor phytoplankton groups followed a similar spatial pattern compared with the total phytoplankton density. The most abundant diatoms were *Thalassiosira spp.* which constituted 5% to 74% of the diatom population in various WCZs. The most abundant dinoflagellate was *Takayama tuberculata*, comprising up to 96% of the dinoflagellate populations in the Deep Bay WCZ.

In 2021, the total number of reported red tide incidents in Hong Kong waters was 11, slightly fewer than the average of 12 incidents in the past five years. Among them, three incidents involved only one WCZ; two incidents involved two WCZs; two incidents involved three WCZs; one incident involved four WCZs and three incidents involved five WCZs. The 11 red tide incidents were caused by eight red tide species, including six dinoflagellates, one diatom and one prymnesiophyte. Nevertheless, these species are non-toxic and no red tides related fish kill in Hong Kong waters was recorded in 2021. The details of red tide incidents in 2021 are shown in the following table.

¹ During the period of special work arrangement implemented under the COVID-19 pandemic in 2021, phytoplankton samples were collected from ten stations only in January 2021.

² Phytoplankton can be classified into different groups based on their morphological characteristics, photosynthetic pigments and nutrition modes. In this report, phytoplankton other than the two major groups, i.e., diatoms and dinoflagellates, are collectively regarded as other minor phytoplankton groups to facilitate the data presentation.

³ Very high density (in excess of 10,000 cells/ml) of the dinoflagellate *Takayama tuberculata* was found in Deep Bay during the month of March to May 2021 due to a month-long red tide event.

Red tide incidents in Hong Kong marine waters in 2021

(Source: Agriculture, Fisheries and Conservation Department)

The number of red tide incidents in Tolo Harbour has dropped significantly from the record high of 43 in 1988 to an annual average of about only five incidents in the past five years. This is attributable to the significant improvement in water quality in the past decades following the successful implementation of the Tolo Harbour Action Plan, as clearly shown in Figure 28.

Water Quality Objective (WQO) for Total Inorganic Nitrogen (TIN) in the 10 Water Control Zones

Summary of Water Quality Objectives (WQOs) for marine waters of Hong Kong		
Parameter	Water Quality Objective	Water Control Zone (WCZ) / Part(s) of zone / Subzone to which the WQO applies
Aesthetic Appearance	There should be no objectionable odours or discolouration of the water. Tarry residues, floating wood, articles made of glass, plastic, rubber or of any other substances should be absent. Mineral oil should not be visible on the surface. Surfactants should not give rise to a lasting foam. There should be no recognisable sewage-derived debris. Floating, submerged and semi-submerged objects of a size likely to interfere with the free movement of vessels or cause damage to vessels should be absent. The waters should not contain substances which settle to form objectionable deposits.	All WCZs (whole zone)
Dissolved Oxygen (bottom)	Not less than 2 mg/L for 90% of samples;	Marine waters of all WCZs except Tolo Harbour & Channel WCZ
Dissolved Oxygen (Depth-averaged)	Not less than 4 mg/L for 90% of samples;	Marine waters of all WCZs except Tolo Harbour & Channel WCZ
Dissolved Oxygen (bottom)	Not less than 2 mg/L	Harbour Subzone in Tolo Harbour & Channel WCZ
	Not less than 3 mg/L	Buffer Subzone in Tolo Harbour & Channel WCZ
	Not less than 4 mg/L	Channel Subzone in Tolo Harbour & Channel WCZ
Dissolved Oxygen (surface to 2m above bottom)	Not less than 4 mg/L	Harbour Subzone and Buffer Subzone in Tolo Harbour & Channel WCZ
Dissolved Oxygen (all depths)	Not less than 4 mg/L	Channel Subzone in Tolo Harbour & Channel WCZ
Nutrients	Annual mean depth-averaged total inorganic nitrogen not to exceed 0.1 mg/L	Marine waters of Southern WCZ and Port Shelter WCZ
	Annual mean depth-averaged total inorganic nitrogen not to exceed 0.3 mg/L	Marine waters of Mirs Bay WCZ, Junk Bay WCZ, North Western WCZ (Castle Peak Subzone)
	Annual mean depth-averaged total inorganic nitrogen not to exceed 0.4 mg/L	Marine waters of Eastern Buffer WCZ, Western Buffer WCZ, Victoria Harbour WCZ
	Annual mean depth-averaged total inorganic nitrogen not to exceed 0.5 mg/L	Marine waters of Deep bay WCZ (Outer Subzone) and North Western WCZ (Whole zone except Castle Peak Subzone)
	Annual mean depth-averaged total inorganic nitrogen not to exceed 0.7 mg/L	Marine waters of Deep Bay WCZ (Inner Subzone)
Unionised Ammonia	Annual mean not to exceed 0.021 mg/L	All WCZs (whole zone) except Tolo Harbour & Channel WCZ
<i>E. coli</i>	Annual geometric mean not to exceed 610 cfu/100mL	Secondary contact recreation subzones in Tolo Harbour & Channel WCZ, Southern WCZ, Port Shelter WCZ, Mirs Bay WCZ, Deep Bay WCZ, North Western WCZ, Western Buffer WCZ
	Annual geometric mean not to exceed 610 cfu/100mL	Fish culture subzones in Tolo Harbour & Channel WCZ, Southern WCZ, Port Shelter WCZ, Junk Bay WCZ, Mirs Bay WCZ, Deep Bay WCZ, Eastern Buffer WCZ, Western Buffer WCZ
pH	To be in the range 6.5 - 8.5, change due to waste discharge not to exceed 0.2	Marine waters of all WCZs except Tolo Harbour & Channel WCZ
	Change due to waste discharge not to be greater than ± 0.5	Harbour Subzone in Tolo Harbour & Channel WCZ
	Change due to waste discharge not to be greater than ± 0.3	Buffer Subzone in Tolo Harbour & Channel WCZ
	Change due to waste discharge not to be greater than ± 0.1	Channel Subzone in Tolo Harbour & Channel WCZ
Salinity	Change due to waste discharge not to exceed 10% of natural ambient level	All WCZs (Whole zone) except Tolo Harbour & Channel WCZ
	Change due to waste discharge not to be greater than ± 3 ppt	Tolo Harbour & Channel WCZ
Temperature	Change due to waste discharge not to exceed 2°C	All WCZs (Whole zone) except Tolo Harbour & Channel WCZ
	Change due to waste discharge not to exceed 1°C	Tolo Harbour & Channel WCZ
Suspended Solids	Waste discharge not to raise the natural ambient level by 30% nor cause the accumulation of suspended solids which may adversely affect aquatic communities	Marine waters of all WCZs except Tolo Harbour & Channel WCZ
Toxicants	Not to be present at levels producing significant toxic effect	All WCZs (Whole zone)
Chlorophyll-a	Not to exceed 20mg/m ³ (μ g/L) calculated as running arithmetic mean of 5 daily measurements for any location and depth	Harbour Subzone in Tolo Harbour & Channel WCZ
	Not to exceed 10mg/m ³ (μ g/L) calculated as running arithmetic mean of 5 daily measurements for any location and depth	Buffer Subzone in Tolo Harbour & Channel WCZ
	Not to exceed 6mg/m ³ (μ g/L) calculated as running arithmetic mean of 5 daily measurements for any location and depth	Channel Subzone in Tolo Harbor & Channel WCZ

Note: 1. Indicate general oceanographic conditions of marine water.

2. Low transparency and light penetration would affect aesthetic value and photosynthesis in marine water.

3. Indicate the amount of particulate organic matters in marine water.

4. Indicate the amount of organic pollutants in marine water.

5. Major nutrients (nitrogen, phosphorus, silica) promoting algal growth in marine water.

6. Indicate the amount of algal biomass in marine water.

7. Sewage bacteria indicate the extent of faecal pollution in marine water.

8. Measuring and reporting of Salinity (S) are based on the Practical Salinity Scale and International Equation of State of Seawater.□

9. Percent saturation of dissolved oxygen is calculated from dissolved oxygen in mg/L based on Weiss R.F. (1970); The solubility of nitrogen, oxygen and argon in water and seawater.

Deep Sea Res. Vol. 17, pp.721-735.

10. Depth profiling - continuous measurements at downcast are processed and presented at 1m intervals from 1m below the surface to 1m above the seabed.

11. If water depth is 6m or above, sampling is taken at three depths: S - 1m below water surface; M - mid-depth of water column; B - 1m above seabed.□

If water depth is 4 to 5 m, "M" is skipped; if water depth is 3m or less, "M" and "B" are skipped.

WQO compliance rates for the Mirs Bay WCZ

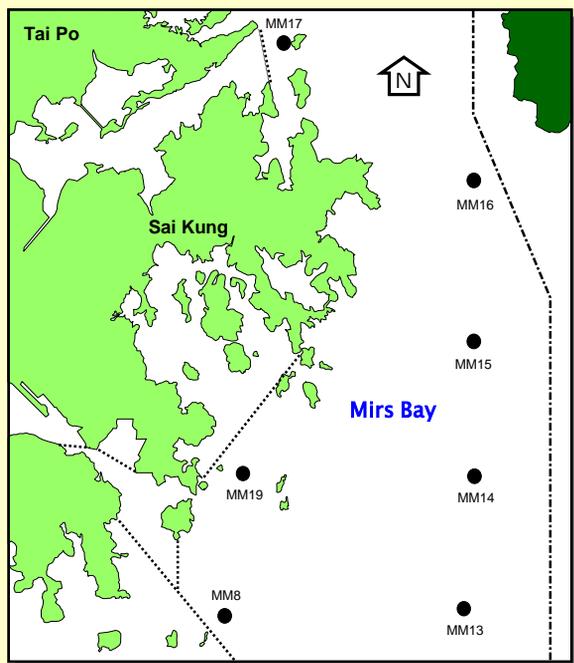

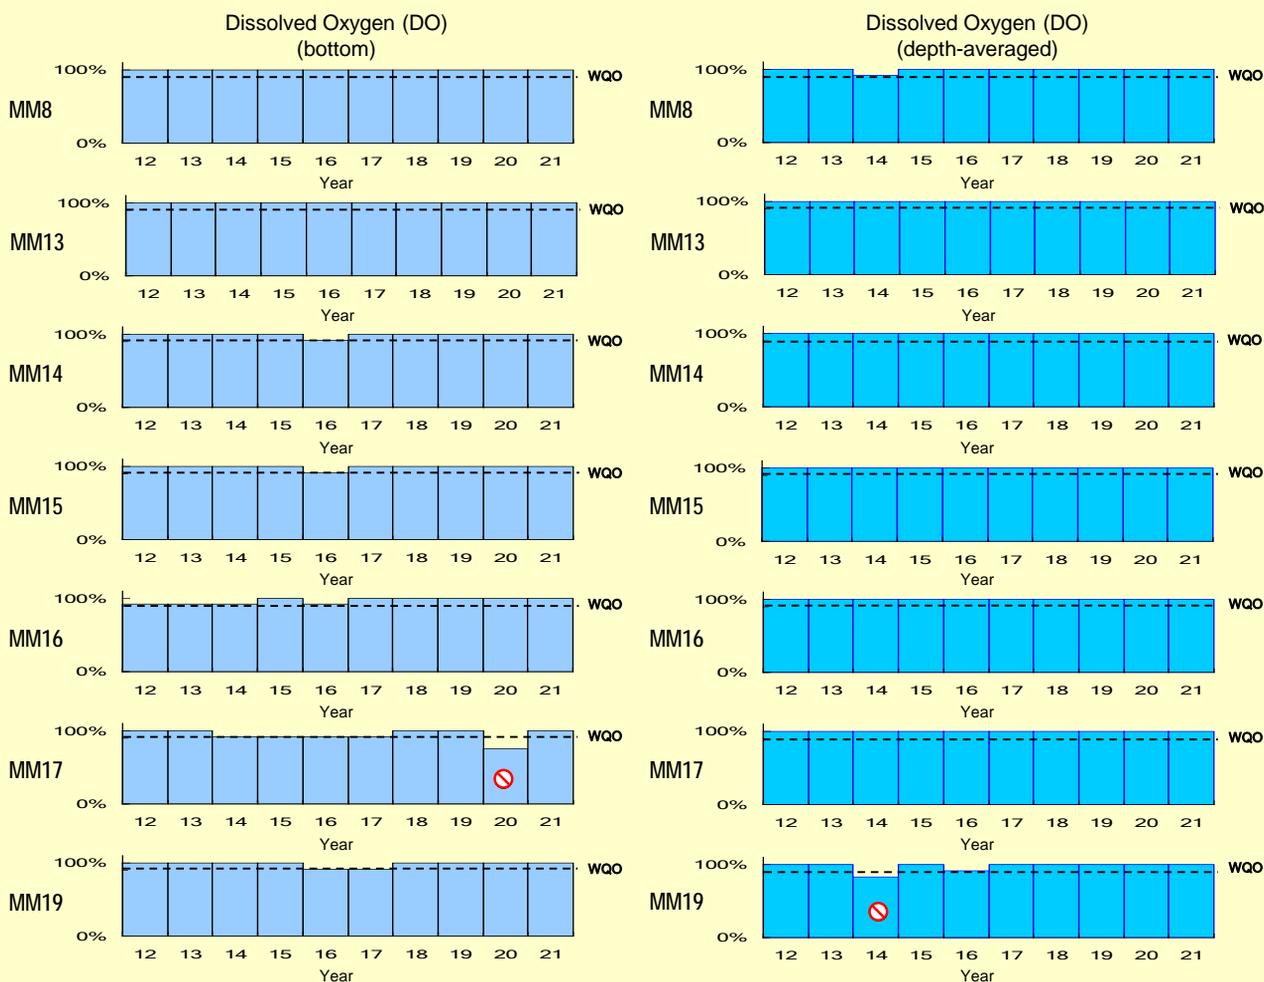

Dissolved Oxygen (DO)

- Bottom**
 WQO: 90% sample with bottom DO \geq 2 mg/L
 Legend: Blue bar = % sample with bottom DO \geq 2 mg/L. Non-compliance (red circle with slash) is shown for years where the bar is below 90%.
- Depth-averaged**
 WQO: 90% sample with depth-averaged DO \geq 4 mg/L
 Legend: Cyan bar = % sample with depth-averaged DO \geq 4 mg/L. Non-compliance (red circle with slash) is shown for years where the bar is below 90%.

 Example: A bar chart showing 100% compliance for most years, but a bar for 2020 is shorter (at ~85%) and has a red 'no' symbol, indicating non-compliance.
- Depth-averaged**
 WQO: 90% sample with depth-averaged DO \geq 4 mg/L
 Legend: Cyan bar = % sample with depth-averaged DO \geq 4 mg/L
 Example: A bar chart showing 100% compliance for most years, but a bar for 2014 is shorter (at ~85%) and has a red 'no' symbol, indicating non-compliance.

Note: 1 Data presented are arithmetic means ; data in brackets indicate ranges.

2 All data are based on the analyses of bulk (unsieved) sediment and are reported on a dry weight basis unless stated otherwise.

3 Total PCBs results are derived from the summation of 18 congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.

4 Low molecular weight polyaromatic hydrocarbons (PAHs) include 6 congeners of molecular weight below 200, namely : Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene and Phenanthrene.

5 High molecular weight polyaromatic hydrocarbons (PAHs) include 10 congeners of molecular weight above 200, namely : Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Dibenz(a,h)anthracene, Ben

6 Low and high molecular weight PAHs results are derived from the summation of the corresponding congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.

Note: 1 Data presented are arithmetic means ; data in brackets indicate ranges.

2 All data are based on the analyses of bulk (unsieved) sediment and are reported on a dry weight basis unless stated otherwise.

3 Total PCBs results are derived from the summation of 18 congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.

4 Low molecular weight polyaromatic hydrocarbons (PAHs) include 6 congeners of molecular weight below 200, namely : Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene and Phenanthrene.

5 High molecular weight polyaromatic hydrocarbons (PAHs) include 10 congeners of molecular weight above 200, namely : Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Dibenz(a,h)anthracene, Ben

6 Low and high molecular weight PAHs results are derived from the summation of the corresponding congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.

Note: 1 Data presented are arithmetic means ; data in brackets indicate ranges.

2 All data are based on the analyses of bulk (unsieved) sediment and are reported on a dry weight basis unless stated otherwise.

3 Total PCBs results are derived from the summation of 18 congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.

4 Low molecular weight polyaromatic hydrocarbons (PAHs) include 6 congeners of molecular weight below 200, namely : Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene and Phenanthrene.

5 High molecular weight polyaromatic hydrocarbons (PAHs) include 10 congeners of molecular weight above 200, namely : Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Dibenz(a,h)anthracene, Ben

6 Low and high molecular weight PAHs results are derived from the summation of the corresponding congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.

3 Total PCBs results are derived from the summation of 18 congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.

4 Low molecular weight polyaromatic hydrocarbons (PAHs) include 6 congeners of molecular weight below 200, namely : Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene and Phenanthrene.

5 High molecular weight polyaromatic hydrocarbons (PAHs) include 10 congeners of molecular weight above 200, namely : Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Dibenzo(a,h)anthracene, Ben

6 Low and high molecular weight PAHs results are derived from the summation of the corresponding congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.

Note: 1 Data presented are arithmetic means ; data in brackets indicate ranges.

2 All data are based on the analyses of bulk (unsieved) sediment and are reported on a dry weight basis unless stated otherwise.

3 Total PCBs results are derived from the summation of 18 congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.

4 Low molecular weight polyaromatic hydrocarbons (PAHs) include 6 congeners of molecular weight below 200, namely : Acenaphthene, Acenaphthylene, Anthracene, Fluorene, Naphthalene and Phenanthrene.

5 High molecular weight polyaromatic hydrocarbons (PAHs) include 10 congeners of molecular weight above 200, namely : Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Dibenzo(a,h)anthracene, Ben

6 Low and high molecular weight PAHs results are derived from the summation of the corresponding congeners. If the concentration of a congener is below report limit (RL), the result will be taken as 0.5xRL in the calculation.
