EXECUTIVE SUMMARY

Since 2007, SkyCity Nine Eagles Golf Course has been operating at Hong Kong International Airport near to Terminal 2. Nine Eagles closed on 31 July 2015 after expiry of operation.

The *EM&A Manual* for Nine Eagles and the Environmental Permit require soil sampling and analysis before the beginning of operation (baseline), during operation (except at inaccessible locations) and after the end of operation. In compliance with these requirements, baseline sampling was carried out in 2006, mid-operation sampling in 2010 and post-operation sampling in 2015.

This *Soil Contamination Assessment Report / Post-operation Monitoring Report* is submitted pursuant to Environmental Permit Condition 2.11(iii) and contains the findings of the final soil sampling carried out at all 12 no. locations (S1-S12) within SkyCity Nine Eagles Golf Course on 11 August 2015.

The post-operation soil sampling and assessment that has been carried out and which is reported here is basically a check that the levels of contaminants in the soil after completion of the operation of the golf course – pesticides in the golf course soil above the sub-surface drainage system, and petroleum hydrocarbons in the ground below the maintenance area and car park – are no greater than those before the start of operation of the golf course, as reported in the *Baseline Monitoring Report* in 2006.

Soil samples from beneath the maintenance area and car park (locations S1 and S4) were analysed for Total Petroleum Hydrocarbons (TPH), whereas soil samples from beneath the golf course and the lake (locations S2, S3 and S5 to S12) were analysed for total pesticides.

With the exception of a low concentration of TPH at S1 at a depth of 1.5m during baseline sampling, TPH were not detected during the baseline sampling nor during the post-operation sampling. It can therefore be concluded that the soil beneath the maintenance area and car park has not been contaminated by golf course operations.

Pesticides were not detected during the baseline sampling, during the mid-operation sampling nor during the post-operation sampling. It can therefore be concluded that the soil beneath the golf course and lakes has not been contaminated by golf course operations.

Overall, therefore, the conclusion of this *Soil Contamination Assessment Report / Post-operation Monitoring Report* is that the operation of SkyCity Nine Eagles Golf Course has not resulted in any detectable soil contamination beneath the car park, maintenance area, lakes or golf course. As such, there is no need for any remediation work to be carried out by the Permit Holder, Airport Management Services Ltd.

1 PROJECT DESCRIPTION

1.1 Introduction

Since 2007, SkyCity Nine Eagles Golf Course (“Nine Eagles”) has been operating at Hong Kong International Airport near to Terminal 2 and adjacent to AsiaWorld-Expo as an interim arrangement prior to the area’s planned development (*see Figure 1-1*). The Golf Course is a Designated Project (DP) under the Environmental Impact Assessment Ordinance (EIAO). A Project Profile was submitted by Bhanja Cheung & Co in February 2006 to obtain the Environmental Permit (EP) required for construction and operation. Nine Eagles was constructed and has operated under EP-229/2005, which was issued on 17 October 2005. Nine Eagles closed on 31 July 2015 after expiry of operation.

Condition 2.11 of the EP relates to soil contamination and reads as follows:

The Permit Holder shall conduct a regular soil sampling and testing before operation, during operation and before expiry of operation of the Project to confirm and verify that there is no land contamination caused as a result of the operation of the golf course. The Permit Holder shall deposit the following submissions to the Director:

- (i) *A soil sampling and monitoring plan no later than two weeks before commencement of construction of the Project to include details of sampling plan, parameters to be analysed, necessary remedial measures and reporting requirements;*
- (ii) *A baseline monitoring report no later than two weeks before operation of the Project to confirm the baseline condition of the soil;*
- (iii) *A soil contamination assessment report no later than four weeks after expiry of operation of the Project to include all soil monitoring and testing results and interpretations and if any remedial measures are required.*

Pursuant to EP 2.11(i) a *Soil Sampling Plan* (SSP) was prepared by Bhanja Cheung & Co, which identified 12 no. sampling locations (S1-S12) and was submitted to the Environmental Protection Department (EPD) in December 2005; pursuant to EP 2.11(ii), a *Baseline Monitoring Report* including sampling results from locations S1-S12 was prepared by Hyder Consulting in November 2006 and submitted to EPD; and pursuant to EP 2.11, soil sampling “during operation” at accessible locations, i.e. excluding S1 (maintenance area), S4 (car park), S5 (Lake A), S6 (Lake A) and S9 (Lake B), was carried out by SMEC Asia in July 2010.

This *Soil Contamination Assessment Report / Post-operation Monitoring Report* is submitted pursuant to EP 2.11(iii) and contains the finding of the final soil sampling carried out at all locations (S1-S12) on 11 August 2015, which was after the end of operation. This report is also referred to as the “*Post-Operation Report (Final Monitoring Report)*” in para.4.5.1 of the *EM&A Manual*. It should be noted that while EP 2.11(iii) required submission of this report “no later than four weeks after expiry of operation of the Project”, the *EM&A Manual* requires submission “no later than two weeks prior to the handover of the project site to the subsequent user”. The submission date of this report has followed the EP requirement, i.e. on or before 27 August 2015.

In addition to the above, the Permit Holder, Airport Management Services Limited, will also surrender the EP under Section 11 of the EIAO.

1.2 Operation

Traditionally, golf courses have used artificial chemical fertilisers and pesticides to maintain the turfgrass to high standards but often, as a result, have caused environmental pollution. Given the location of Nine Eagles within the areas frequented by Chinese White Dolphins and close to the ecologically sensitive Tung Chung Bay, the Project Proponent committed in the Project Profile to operating the golf course using “organic” principles, without the use of artificial chemical fertilisers or pesticides.

The Golf Course has been designed to contain water within two artificial lakes, which are linked together by two underwater pipes. The lakes provide a source of freshwater for irrigation. All rainwater and surplus irrigation water collected within the Golf Course will drain back into the lakes for reuse, through a sub-soil drainage system, shown in **Figure 1-2**.

1.3 Purpose of this Report

The post-operation soil sampling and assessment that has been carried out and is reported here is basically a check that the levels of contaminants in the soil after completion of the operation of the golf course – pesticides in the golf course soil above the sub-surface drainage system, and petroleum hydrocarbons in the ground below the maintenance area and car park – are no greater than those before the start of operation of the golf course, as reported in the *Baseline Monitoring Report* in 2006.

In the *Soil Sampling Plan*, issued in 2005, reference was made to Appendix IV of *ProPECC PN3/94 Contaminated Land Assessment and Remediation* (which lists soil and groundwater criteria used in the Netherlands for contaminated land – the “Dutch List”) to justify the list of contaminants proposed for soil sampling. The *Soil Sampling Plan* also confirmed that “there is no reason to suspect that the site has been contaminated by previous uses” and therefore that the soil beneath the golf course prior to operation was considered to be uncontaminated.

As there is potential for chemicals used in the operation of the Golf Course to cause soil contamination, the purpose of soil sampling and analysis for this project (EP condition 2.11 refers) is to demonstrate that soil has not been contaminated by golf course operations. Hence, the analysis of samples in this report will be compared only to the baseline analysis (before operation), not to EPD’s Risk Based Remediation Goals (RBRG), which have superseded Dutch List.

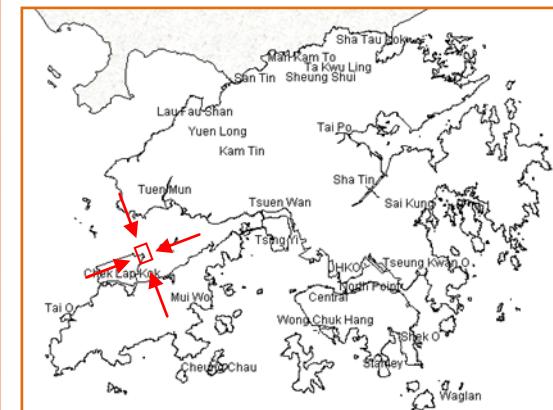

The purpose of the soil sampling and analysis presented in this report is NOT to determine the acceptability of the site for future development by reference to RBRG, but to confirm that soil has not been contaminated by golf course operations.

2 SAMPLING METHODOLOGY

2.1 Overview

The *Soil Sampling Plan* identified sampling locations (shown in **Figure 2-1**), parameters for analysis and frequency of sampling as shown in **Table 2-1**.

Table 2-1 Description of Sampling Points

Sampling Point	Location	Parameter		Frequency		
		Total Pesticides	Total Petroleum Hydrocarbons	Before Beginning of Operation	Mid point of Operation	After End of Operation
S1	Maintenance Facility		✓	✓	--	✓
S2	Fairway	✓		✓	✓	✓
S3	Fairway	✓		✓	✓	✓
S4	Car Park		✓	✓	--	✓
S5	Lake A	✓		✓	--	✓
S6	Lake A	✓		✓	--	✓
S7	Rough	✓		✓	✓	✓
S8	Green	✓		✓	✓	✓
S9	Lake B	✓		✓	--	✓
S10	Green	✓		✓	✓	✓
S11	Rough	✓		✓	✓	✓
S12	Rough	✓		✓	✓	✓

Note: -- Inaccessible during operation of golf course therefore not sampled.

Source: Table 4.2 of the *Soil Sampling Plan*, 2005.

Three rounds of soil sampling have been carried out at Nine Eagles:

1. Pre-operation (baseline) conducted on 19 May and 29 September 2006 and reported in the *Baseline Monitoring Report*, dated November 2006. Sampling was carried out at all 12 no. sampling locations.
2. Mid-operation soil sampling conducted on 27 July 2010. Sampling was carried out at all accessible locations, i.e. at S2, S3, S7, S8 and S10 to S12, but not at S1, S4 to S6 nor S9, which were inaccessible (i.e. beneath maintenance area, car park or lakes).
3. Post-operation soil sampling conducted on 11 August 2015 and the analysis is presented in this report. Sampling was carried out at all 12 no. sampling locations.

2.2 Post-operation Sampling Methodology

For the maintenance area and car park (locations S1 and S4), sampling was carried out at three depths, namely 0.5m, 1m and 1.5m respectively, by means of trail pit. Given the use of these areas, the parameter to be analysed was total petroleum hydrocarbons (TPH). Within the golf course area (locations S2, S3, S7, S8, S10, S11 and S12) samples were taken from within the 200-300mm deep sand layer that lies above the sub-base but below the turfgrass. To maintain consistency within the area occupied by the artificial lakes (locations S5, S6 and S9), samples were also taken at 200-300mm below the final lake bed level. The parameter to be analysed at these locations is total pesticides.

Samples from locations S1 and S4 were analysed in a HOKLAS laboratory to determine the existing (post-operation) concentrations of TPH. Samples from all other locations were analysed in a laboratory to determine the existing (post-operation) concentrations of total pesticides.

In general, TPH consists of four hydrocarbon fractions, namely C6-C9, C10-C14, C15-C28 and C29-C36, all of which are analysed. Each fraction consists petroleum molecules with the number of carbon atoms in the range as indicated. Petrol is one of the common light petroleum hydrocarbons and falls within the C6-C9 fraction. Diesel is one of the common heavy petroleum hydrocarbons and falls within C15-C28 fraction. Detection limits for C6-C9, C10-C14, C15-C28 and C29-C35 range from 2mg/kg to 100mg/kg.

Total pesticides consist of organochlorine pesticides, organophosphorus pesticides and triazine pesticides all of which were analysed. The detection limit of these pesticides is 0.05mg/kg.

All soil samples taken were placed in a sample containers provided by the HOKLAS laboratory. Sufficient sample size was collected for the laboratory analysis. Samples were marked with the name of the site, sampling identification number and sampling depth with appropriate chain-of-custody form. Following sampling, samples were stored in a cool box at a temperature of between 0°C and 4°C and transported to the laboratory immediately after completion of sampling.

In order to avoid cross-contamination, all sampling equipment was thoroughly decontaminated or cleaned prior to sampling, by washing with non-phosphate detergent and rinsing with distilled water.

2.3 Analysis

The detailed analytical results of the baseline, interim and post operation soil samples are given in [Appendix 1](#) to [Appendix 3](#), respectively.

Table 2-2 summarises the results of the analysis of TPH at locations S1 and S4 by providing a comparison between the results of the baseline and post-operation sampling (no mid-operation sampling was carried out at S1 and S4 because these locations are beneath the maintenance area and car park were therefore inaccessible while the golf course was operating).

Table 2-2 Summary of Analytical Results for TPH at S1 and S4

Sample	Depth (m)	TPH (mg/kg)		
		Baseline (19 May 2006)	Mid-operation (27 Jul 2010)	Post-operation (11 Aug 2015)
S1	0.5	ND	--	ND
	1.0	ND	--	ND
	1.5	251	--	ND
S4	0.5	ND	--	ND
	1.0	ND	--	ND
	1.5	ND	--	ND

Note: ND Not detected

-- Inaccessible during operation of golf course therefore not sampled.

From the above it can be seen that with the exception of a low concentration of TPH at S1 at a depth of 1.5m during baseline sampling, TPH were not detected during baseline sampling nor during post-operation sampling. TPH at S1 at a depth of 1.5m was no longer detectable during post-operation sampling, likely the result of natural breakdown of hydrocarbons by soil micro-organisms over time. Based on the above, it can be concluded that the soil beneath the maintenance area and car park has not been contaminated by golf course operations.

Table 2-3 summarises the results of the analysis of total pesticides at locations S2, S3 and S5 to S12 by providing a comparison between the results of the baseline, mid-operation and post-operation sampling (no mid-operation sampling was carried out at S5, S6 or S9 because these locations are beneath the lakes and were therefore inaccessible while the golf course was operating).

Table 2-3 Summary of Analytical Results for Total Pesticides at S2, S3 and S5 to S12

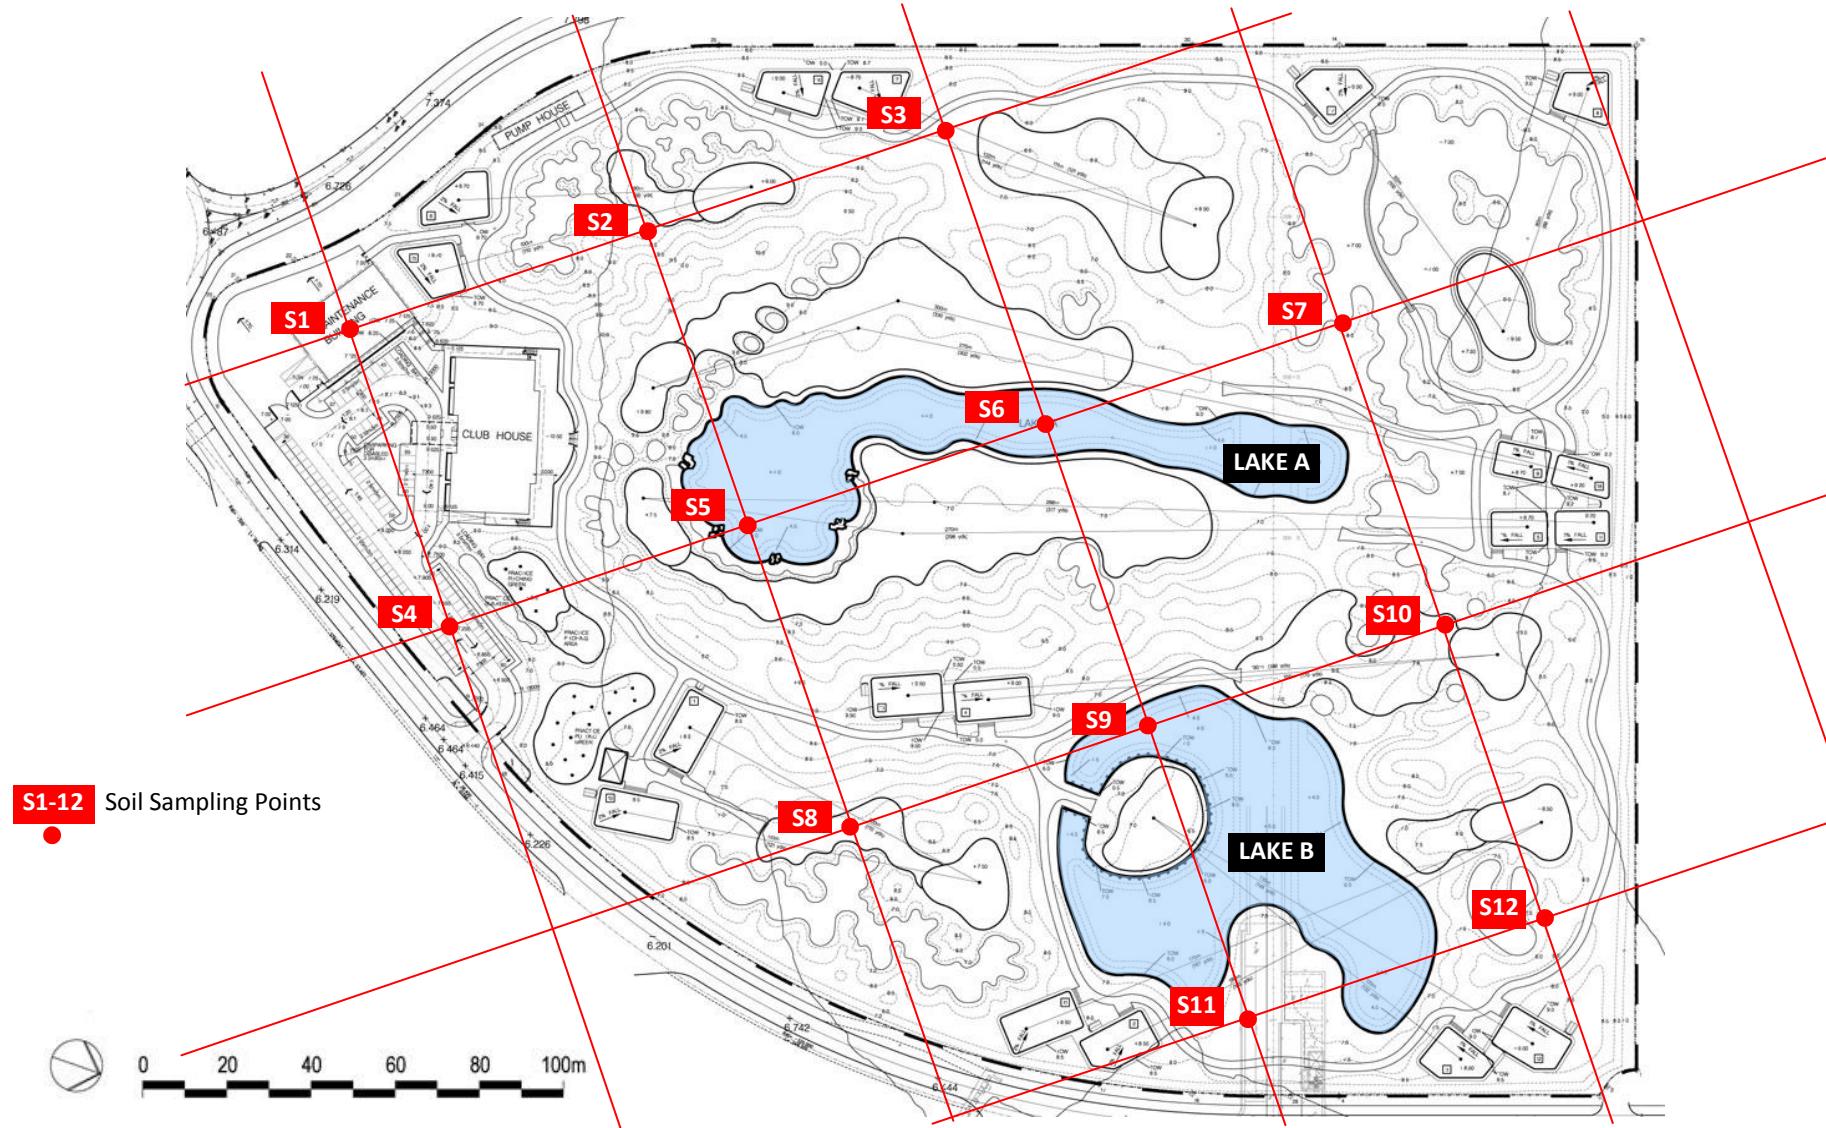

Sample	Depth (m)	Total Pesticides (mg/kg)		
		Baseline (19 May 2006)	Mid-operation (27 Jul 2010)	Post-operation (11 Aug 2015)
S2	0.2	ND	ND	ND
S3	0.2	ND	ND	ND
S5	0.2	ND	--	ND
S6	0.2	ND	--	ND
S7	0.2	ND	ND	ND
S8	0.2	ND	ND	ND
S9	0.2	ND	--	ND
S10	0.2	ND	ND	ND
S11	0.2	ND	ND	ND
S12	0.2	ND	ND	ND

Note: ND Not detected

-- Inaccessible during operation of golf course therefore not sampled.

From the above it can be seen that pesticides were not detected during baseline sampling, during mid-operation sampling nor during post-operation sampling. Based on the above, it can be concluded that the soil beneath the golf course and lakes has not been contaminated by golf course operations.

Figure 2-1 Locations of Soil Sampling Points

3 CONCLUSION

The *EM&A Manual* for Nine Eagles and the Environmental Permit require soil sampling and analysis before the beginning of operation (baseline), during operation (except at inaccessible locations) and after the end of operation. In compliance with these requirements, baseline sampling was carried out in 2006, mid-operation sampling in 2010 and post-operation sampling in 2015.

Soil samples from beneath the maintenance area and car park (locations S1 and S4) were analysed for Total Petroleum Hydrocarbons (TPH), whereas soil samples from beneath the golf course and the lakes (locations S2, S3 and S5 to S12) were analysed for total pesticides.

With the exception of a low concentration of TPH at S1 at a depth of 1.5m during baseline sampling, TPH were not detected during baseline sampling nor during post-operation sampling at locations S1 and S4 (locations S1 and S4 beneath the maintenance area and car park were inaccessible during mid-operation sampling). TPH at S1 at a depth of 1.5m was no longer detectable during post-operation sampling, likely the result of natural breakdown of hydrocarbons by soil micro-organisms over time. Based on the above, it can be concluded that the soil beneath the maintenance area and car park has not been contaminated by golf course operations.

Pesticides were not detected during baseline sampling, during mid-operation sampling nor during post-operation sampling (locations S5, S6 and S9 below the lakes were inaccessible during mid-operation sampling). Based on the above, it can be concluded that the soil beneath the golf course and lakes has not been contaminated by golf course operations.

Overall, therefore, the conclusion of this *Soil Contamination Assessment Report / Post-operation Monitoring Report* is that the operation of SkyCity Nine Eagles Golf Course has not resulted in any detectable soil contamination beneath the maintenance area, car park, lakes or golf course. As such, there is no need for any remediation work to be carried out by the Permit Holder, Airport Management Services Ltd.

General Comments

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release. When date(s) and/or time(s) are shown bracketed, these have been assumed by the laboratory for processing purposes. If the sampling time is displayed as 0:00 the information was not provided by client. The completion date of analysis is:
30-JUL-2010

Key: LOR = Limit of reporting; CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

Specific comments for Work Order: **HK1016979**

Sample(s) were collected by ALS Technichem (HK) staff on 27 July, 2010.

Soil sample(s) analysed on an as received basis. Result(s) reported on a dry weight basis.

This report may not be reproduced except with prior written approval from the testing laboratory.

This document has been electronically signed by those names that appear on this report and are the authorised signatories. Electronic signing has been carried out in compliance with procedures specified in the Electronic Transactions Ordinance of Hong Kong, Chapter 553, Section 6.

General Comments

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release. When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes. The completion date of analysis is:
19-AUG-2015

Key: LOR = Limit of reporting; CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

Specific comments for Work Order: **HK1529679**

Sample(s) were picked up from client by ALS Technichem (HK) staff in a chilled condition.

Soil sample(s) analysed on an as received basis. Result(s) reported on a dry weight basis.

This report may not be reproduced except with prior written approval from the testing laboratory.

This document has been electronically signed by those names that appear on this report and are the authorised signatories. Electronic signing has been carried out in compliance with procedures specified in the Electronic Transactions Ordinance of Hong Kong, Chapter 553, Section 6.
