EXECUTIVE SUMMARY

The baseline noise monitoring was carried out at all designated noise monitoring locations described in the updated EM&A Manual between 4 December 2009 and 17 December 2009. For baseline noise levels, continuous $L_{\rm eq}$ (5-minutes) were recorded. There was no major activity or extreme weather influencing the measured noise level during the baseline noise monitoring period.

The averaged baseline noise levels are summarized in the following table:

Noise Monitoring Location	M1a	M2a	М3	M4a	М5а	M6
Averaged baseline noise level during 0700-1900hrs on normal weekdays, (dB(A))	69.2	73.7	68.3	68.6	67.2	70.7
Averaged baseline noise level for all days during evening (1900-2300hrs), and general holidays (including Sundays) during the daytime and evening (0700-2300hrs), (dB(A))	60.1	67.7	61.0	63.7	61.9	65.3
Averaged baseline noise level for all days during the nighttime (2300-0700hrs), (dB(A))	57.2	65.3	58.9	60.9	58.9	61.8

1 INTRODUCTION

1.1 Background

- 1.1.1 The Project is located mainly in Wan Chai North, Causeway Bay and North Point, and is demarcated by Gloucester Road and Victoria Park Road to the south, Fenwick Pier Street to the west and Tong Shui Road Interchange to the east.
 - 1.1.2 The project area encompasses existing developments along the Wan Chai, Causeway Bay and North Point shorelines. Major land uses include the Hong Kong Convention & Exhibition Centre (HKCEC) Extension, the Wan Chai Ferry Pier, the ex-Wan Chai Public Cargo Working Area (ex-PCWA), the Royal Hong Kong Yacht Club (RHKYC), the Police Officers' Club, the Causeway Bay Typhoon Shelter (CBTS) and commercial and residential developments.
- 1.1.3 The scope of the Project comprises:
 - (i) Land formation for key transport infrastructure and facilities, including the Trunk Road (i.e. CWB) and the associated slip roads for connection to the Trunk Road and for through traffic from Central to Wan Chai and Causeway Bay. The land formed for the above transport infrastructure will provide opportunities for the development of an attractive waterfront promenade for the enjoyment of the public.
 - (ii) Reprovisioning / protection of the existing facilities and structures affected by the land formation works mentioned above.
 - (iii) Extension, modification, reprovisioning or protection of existing storm water drainage outfalls, sewerage outfalls and watermains affected by the revised land use and land formation works mentioned above.
 - (iv) Upgrading of hinterland storm water drainage system and sewerage system, which would be rendered insufficient by the land formation works mentioned above.
 - (v) Provision of the ground level roads, flyovers, footbridges, necessary transport facilities and the associated utility services.
 - (vi) Construction of the new waterfront promenade, landscape works and the associated utility services.
 - (vii) The Trunk Road (i.e. CWB) within the project area and the associated slip roads for connection to the Trunk Road.
- 1.1.4 The proposed Project is an engineering feasibility study of an urban development project with a project area covering more than 20 ha. Under the EIAO, this Project is classified as a Schedule 3 Designated Project (DP) under item 1 of the Schedule 3 "Major Designated Projects Requiring Environmental Impact Assessment Reports". The Project also contains various Schedule 2 DPs that, under the EIAO, require Environmental Permits (EPs) to be granted by the DEP before they may be either constructed or operated.

1.2 Purpose of Baseline Noise Monitoring Report

- 1.2.1 The purpose of this report is to review the baseline conditions of noise levels at the Project site.
- 1.2.2 This baseline monitoring report presents the baseline monitoring requirements, methodologies and monitoring results at 6 noise monitoring locations described in the updated EM&A Manual.
- 1.2.3 The baseline monitoring results for air quality, water quality and coral survey will be presented in their individual baseline monitoring reports.

2 NOISE MONITORING

- 2.1 Monitoring Requirements
- 2.1.1 In accordance with the updated EM&A Manual, baseline noise monitoring at 6 monitoring locations was conducted, for consecutively 14 days, to obtain background noise levels at the area.

2.2 Monitoring Equipment

2.2.1 Noise monitoring was performed using sound level meter at each designated monitoring locations. The sound level meters deployed comply with the International Electrotechnical Commission Publications (IEC) 651:1979 (Type 1) and 804:1985 (Type 1) specifications. Acoustic calibrator was deployed to check the sound level meters at a known sound pressure level. Brand and model of the equipment is given in **Table 2.1**.

Table 2.1 Noise Monitoring Equipment

Equipment	Brand and Model	
	B&K (Model No. 2238)	
Integrated Sound Level Meter	B&K (Model 2250L)	
	Rion (Model NL-31)	
Acoustic Calibrator	B&K (Model No. 4231)	
Acoustic Calibrator	Rion NC-73	

2.3 Monitoring Locations

2.3.1 In accordance with the updated EM&A Manual, the noise monitoring stations for baseline noise monitoring is presented in **Table 2.2** and shown in **Figure 2.1**.

Table 2.2 Baseline Noise Monitoring Stations

Monitoring Location	Description	Level (in terms of no. of floor)
M1a	Harbour Road Sports Centre	3 (roof-top)
M2a	Caltex Petrol Filling Station	2 (roof-top)
M3	Mayson Garden	24 (roof-top)
M4a	Causeway Bay Community Centre	4
M5a	Electric Centre	10 (roof-top)
M6	Hong Kong Baptist Church Henrietta Secondary School	6 (roof-top)

2.4 Monitoring Parameters, Frequency and Duration

2.4.1 The monitoring parameters, frequency and duration of noise monitoring are summarized in **Table 2.3**.

Table 2.3 Noise Monitoring Parameters, Frequency and Duration

Time Period	Duration, min	Parameters
0700-1900 hrs on normal weekdays	L _{eq} (30-min)	L _{ea}
Time period other than 0700-1900 hrs on normal weekdays	L _{eq} (5-min)	

2.5 Monitoring Methodology

2.5.1 Monitoring Procedure

- (a) Façade measurements were made at all monitoring locations.
- (b) The battery condition was checked to ensure the correct functioning of the meter.
- (c) Parameters such as frequency weighting, the time weighting and the measurement time were set as follows:
 - (i) frequency weighting: A
 - (ii) time weighting: Fast
 - time measurement: $L_{eq}(30\text{-minutes})$ were recorded for the period between 0700 and 1900 hours on normal weekdays. For all other time periods, L_{eq} (5-minutes) were recorded.
- (d) Prior to and after each noise measurement, the meter was calibrated using the acoustic calibrator for 94dB(A) at 1000 Hz. If the difference in the calibration level before and after measurement was more than 1 dB(A), the measurement would be considered invalid and repeat of noise measurement would be required after re-calibration or repair of the equipment.
- (e) Noise monitoring was cancelled in the presence of fog, rain, wind with a steady speed exceeding 5m/s, or wind with gusts exceeding 10m/s.

2.5.2 Maintenance and Calibration

- (a) The microphone head of the sound level meter was cleaned with soft cloth at regular intervals.
- (b) The meter and calibrator were sent to the supplier or Soils and Materials Engineering Co. Ltd. to check and calibrate at yearly intervals.
- (c) Calibration certificates of the sound level meters and acoustic calibrators are provided in **Appendix A**.

2.6 Results and Observations

- 2.6.1 There was no other major activity influencing the measured noise level during the baseline noise monitoring period. The dominant noise sources were from community noises, school activities and nearby traffic emissions.
- 2.6.2 Baseline noise monitoring was conducted for consecutively 14 days, from 4 December 2009 to 17 December 2009.
- 2.6.3 The baseline noise monitoring results are summarized in **Table 2.4**, **2.5 and 2.6**. Detailed noise monitoring results are presented in **Appendix B**.

Table 2.4 Summary of Baseline Noise Monitoring Results (0700-1900 hrs on normal weekdays)

0700-1900 hrs of normal	L _{eq} (30-min), d(B)A		
weekdays	Average	Range

M5a	58.9	54.2 - 62.4	
M6	61.8	58.8 - 64.1	

2.7 Event and Action Levels

2.7.1 The Action and Limit Levels of noise monitoring have been set in accordance with the derivation criteria specified in the updated EM&A Manual as shown in **Table 2.7** below.

Table 2.7 Action and Limit Levels for Construction Noise

Time Period	Action Level	Limit Level
0700 – 1900 hours	When one documented complaint	75 dB(A) *
on normal weekdays	is received	

Notes: If works are to be carried out during restricted hours, the conditions stipulated in the Construction Noise Permit (CNP) issued by the Noise Control Authority have to be followed.

^{* 70} dB(A) and 65 dB(A) for schools during normal teaching periods and school examination periods, respectively.

2.8 Event and Action Plan

2.8.1 Should non-compliance of the criteria occur, action in accordance with the Event and Action Plan in **Table 2.8** shall be implemented.

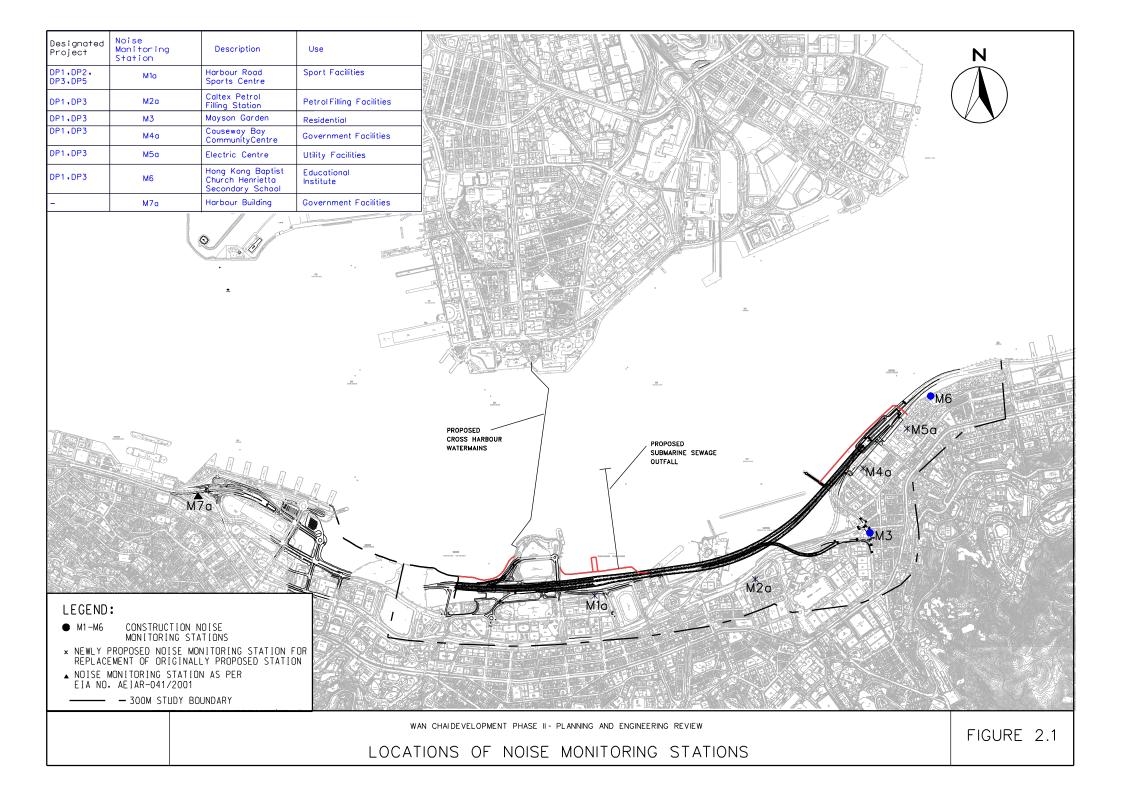

Table 2.8 Event/Action Plan for Construction Noise

EVENT		ACT	TION	
	ET	IEC	ER	CONTRACTOR
Action Level being exceeded	1. Notify ER, IEC and Contractor; 2. Carry out investigation; 3. Report the results of investigation to the IEC, ER and Contractor; 4. Discuss with the IEC and Contractor on remedial measures required; 5. Increase monitoring frequency to check mitigation effectiveness. (The above actions should be taken within 2 working days after the exceedance is identified)	1. Review the investigation results submitted by the ET; 2. Review the proposed remedial measures by the Contractor and advise the ER accordingly; 3. Advise the ER on the effectiveness of the proposed remedial measures. (The above actions should be taken within 2 working days after the exceedance is identified)	Confirm receipt of notification of failure in writing; Notify Contractor; In consolidation with the IEC, agree with the Contractor on the remedial measures to be implemented; Supervise the implementation of remedial measures. (The above actions should be taken within 2 working days after the exceedance is identified)	Submit noise mitigation proposals to IEC and ER; Implement noise mitigation proposals. (The above actions should be taken within 2 working days after the exceedance is identified)
Limit Level being exceeded	1. Inform IEC, ER, Contractor and EPD; 2. Repeat measurements to confirm findings; 3. Increase monitoring frequency; 4. Identify source and investigate the cause of exceedance; 5. Carry out analysis of Contractor's working procedures; 6. Discuss with the IEC, Contractor and ER on remedial measures required; 7. Assess effectiveness of Contractor's remedial actions and keep IEC, EPD and ER informed of the results; 8. If exceedance stops, cease additional monitoring. (The above actions should be taken within 2 working days after the exceedance is identified)	Discuss amongst ER, ET, and Contractor on the potential remedial actions; Review Contractor's remedial actions whenever necessary to assure their effectiveness and advise the ER accordingly. (The above actions should be taken within 2 working days after the exceedance is identified)	Confirm receipt of notification of failure in writing; Notify Contractor; In consolidation with the IEC, agree with the Contractor on the remedial measures to be implemented; Supervise the implementation of remedial measures; If exceedance continues, consider stopping the Contractor to continue working on that portion of work which causes the exceedance until the exceedance is abated. (The above actions should be taken within 2 working days after the exceedance is identified)	1. Take immediate action to avoid further exceedance; 2. Submit proposals for remedial actions to IEC and ER within 3 working days of notification; 3. Implement the agreed proposals; 4. Submit further proposal if problem still not under control; 5. Stop the relevant portion of works as instructed by the ER until the exceedance is abated. (The above actions should be taken within 2 working days after the exceedance is identified)

3 CONSLUSIONS AND RECOMMENDATIONS

3.1.1 Baseline noise monitoring was carried out from 4 December to 17 December 2009 at 6 monitoring locations. The Action Level of construction noise is based on documented complaints received, while the Limit Level is the level at a specific limit according to EIAO-TM. No recommendation was provided in this baseline noise monitoring report.

Air pressure:

(1000 ± 10) hPa

Test specifications

 The Sound Level Meter has been calibrated in accordance with the requirements as specified in BS 7580; Part 1: 1997 and the lab calibration procedure SMTP004-CA-152.

 The electrical tests were performed using an electrical signal substituted for the microphone which was removed and replaced by an equivalent capacitance within a tolerance of ±20%.

3, The acoustic calibration was performed using an B&K 4226 sound calibrator and corrections was applied for the difference between the free-field and pressure responsess of the Sound Level Meter.

Test results

This is to certify that the Sound Level Meter conforms to BS 7580: Part 1: 1997 for the conditions under which the test was performed.

Details of the performed measurements are presented on page 2 of this certificate.

Hong Kong Accreditation Service (HKAS) has accredited this laboratory under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) for specific laboratory activities as listed in the HOKLAS Directory of Accredited Laboratories. The results shown in this certificate were determined by this laboratory in accordance with its terms of accreditation. Such terms of accreditation stipulate that the results shall be traceable to the International System of Units (S.I.) or recognised measurement standards. This certificate shall not be reproduced except in full.

Test specifications

- The Sound Level Meter has been calibrated in accordance with the requirements as specified in BS 7580: Part 1: 1997
 and the lab calibration procedure SMTP004-CA-152.
- The electrical tests were performed using an electrical signal substituted for the microphone which was removed and replaced by an equivalent capacitance within a tolerance of ±20%.
- The acoustic calibration was performed using an B&K 4226 sound calibrator and corrections was applied for the difference between the free-field and pressure responsess of the Sound Level Meter.

Test results

This is to certify that the Sound Level Meter conforms to BS 7580: Part 1: 1997 for the conditions under which the test was performed.

Details of the performed measurements are presented on page 2 of this certificate.

Actual Measurement data are documented on worksheets.

Test specifications

The Sound Level Meter has been calibrated in accordance with the requirements as specified in BS 7580: Part 1: 1997 1. and the lab calibration procedure SMTP004-CA-152.

2, The electrical tests were performed using an electrical signal substituted for the microphone which was removed and replaced by an equivalent capacitance within a tolerance of ±20%.

The acoustic calibration was performed using an B&K 4226 sound calibrator and corrections was applied for the difference 3, between the free-field and pressure responsess of the Sound Level Meter.

Test results

This is to certify that the Sound Level Meter conforms to BS 7580: Part 1: 1997 for the conditions under which the test was performed.

Details of the performed measurements are presented on page 2 of this certificate.

Test specifications

- The Sound Calibrator has been calibrated in accordance with the requirements as specified in IEC 60942 1997 Annex B 1, and the lab calibration procedure SMTP004-CA-156.
- 2. The calibrator was tested with its axis vertical facing downwards at the specific frequency using insert voltage technique.
- 3, The results are rounded to the nearest 0.01 dB and 0.1 Hz and have not been corrected for variations from a reference pressure of 1013,25 hectoPascals as the maker's information indicates that the instrument is insensitive to pressure changes.

Test results

This is to certify that the sound calibrator conforms to the requirements of annex B of IEC 60942: 1997 for the conditions under which the test was performed. This does not imply that the sound calibrator meets IEC 60942 under any other conditions.

Details of the performed measurements are presented on page 2 of this certificate.

1, Measured Sound Pressure Level

The output Sound Pressure Level in the calibrator head was measured at the setting and frequency shown using a calibrated laboratory standard microphone and insert voltage technique. The results are given in below with the estimated uncertainties.

	•		(Output level in dB re 20 pPa)
Frequency	Output Sound Pressure	Measured Output	Estimated
Shown	Level Setting	Sound Pressure Level	Uncertainty
Hz	d₿	- dB	dB
1000	94.00	94.10	0.1

2, Sound Pressure Level Stability - Short Term Fluctuations

The Short Term Fluctuations was determined by measuring the maximum and minimum of the fast weighted DC output of the B&K 2610 measuring amplifier over a 20 second time interval as required in the standard. The Short Term Fluctuation was found to be:

At 1000 Hz

STF = 0.002 dB

Estimated uncertainty

0.005 dB

3, Actual Output Frequency

The determination of actual output frequency was made using a B&K 4180 microphone together with a B&K 2673 preamplifier connected to a B&K 2610 measuring amplifier. The AC output of the B&K 2610 was taken to an universal counter which was used to determine the frequency averaged over 20 second of operation as required by the standard. The actual output frequency at 1 KHz was:

At 1000 Hz

Actual Frequency = 999.8 Hz

Estimated uncertainty

0.1 Hz

Coverage factor k = 2.2

4, Total Noise and Distortion

For the Total Noise and Distortion measurement, the unfiltered AC output of the B&K 2610 measuring amplifier was connected to an Agilent Type 8903 B distortion analyser. The TND result at 1 KHz was:

At 1000 Hz

TND = 0.5%

Estimated uncertainty

0.7%

The uncertainties have been calculated in accordance with the ISO Publication "Guide to the expression of uncertainty in measurement", and gives an interval estimated to have a level of confidence of 95 %. A coverage factor of 2 is assumed unless explicitly stated.

Coverage factor k = 2.2

4, Total Noise and Distortion

For the Total Noise and Distortion measurement, the unfiltered AC output of the B&K 2610 measuring amplifier was connected to an Acilent Type 8903 B distortion analyser. The TND result at 1 KHz was:

At 1000 Hz

TND = 0.8%

Estimated uncertainty

0.7%

The uncertainties have been calculated in accordance with the ISO Publication "Guide to the expression of uncertainty in measurement", and gives an interval estimated to have a level of confidence of 95 %. A coverage factor of 2 is assumed unless explicitly stated.

End

Calibrated by:

C.Y. Fung 13-Mar-2009 Checked by:

ato.

7-Mar-2009

The standard(s) and equipment used in the calibration are traceable to national or international recognised standards and are calibrated on a schedule to maintain the required accuracy level.

Responses to Comments

Environmental Impact Assessment (EIA) Ordinance, Cap. 499 Environmental Permits Nos.: EP-356/2009 & EP-364/2009 Wan Chai Development Phase II and Central-Wan Chai Bypass Baseline Noise Montioring Reports (Dec2009)

Response to Comment - EPD's letter ref.: (25) in EP2/H4/S3/15 Pt.3 dated 25 January 2010

Comments	Reponses	
Initial Comments:		
General:		
(1) The baseline report was submitted to meet the requirements of the capitoned 2 permits. Since the scopes of the two permits are different and the EM&A requirements shall follow the 2 standardalone EM&A Manuals to be approved under each of the 2 permits, two standalone baseline montioring reports shall be submitted to meet the requirements of the 2 permits separately.	As the works under the two separate permits are actually carried out together under a number of works contracts divided geographically, and the EM&A works for all these works contracts (with DPs) are conducted by a single ET and verified by a single IEC, we suggest the updated EM&A Manuals for these two permits are combined into a single volume which is applicable to both EPs, with those EM&A items applicable to only one particular EP properly annotated. This will give a more complete overall picture of the EM&A for the whole Project.	
Specific:		
Background		
(2) S1.1: The project locations and scopes of the 2 permits are different. The project site of EP-364/2009 includes Central harbourfront area (but not mentioned in s.1.1.1). The term "study area" should be replaced by "proejct area" in the baseline reports where appropriate. S1.1.4 copying from the WDII&CWB EIA report should be amended to suit the corresponding baseline reports.	Noted and the wordings will be revised.	
Proposed alternative monitoring location		
Sections 2.3 of Baseline Report:		
(3) It is noted that some alternative noise monitoring locations are proposed when compared with the EIA reports. According to S2.3.2, Appendix D2, 'Guidelines for Development project in Hong Kong – Environmental Monitoring and Audit,"When alternative monitoring locations are proposed, the monitoring locations shall be chosen based on the following criteria: (a) at locations close to the major site activities which are likely to have noise impacts; (b) close to the noise sensitive receivers (N.B. For the purposes of this section, any domestic premises, hotel, hostel, temporary housing accommodation, hospital, medical clinic, educational institution, place of public worship, library, court of law, performing art centre shall be considered as a noise	The noise monitoring stations at roof-top of Mayson Garden (M3) and Harbour Building (MA1b) are the only accessible buildings for installing the equipment to carry out the consecutive 14-day baseline noise monitoring. None of the nearby low-rise locations are allowed for such monitoring. Therefore, these two locations are considered to be the best alternative locations.	

Noted and will be amended.
Noted and will be provided.
