EXECUTIVE SUMMARY

This environmental baseline report has been prepared by the ERM-Hong Kong Ltd. for “HY/2000/21 - Route 9 Ngong Shuen Chau Viaduct Contract”. This report presents the baseline noise and air monitoring works undertaken in June 2002.

The baseline 24-hour and 1-hour Total Suspended Particulates (TSP) and noise monitoring were conducted in accordance with the Environmental Permit No. EP-085/2000/A and EM&A Manual at two designated locations at Mei Foo Sun Chuen and Stonecutters Island from 1 to 19 June 2002.

For Mei Foo Sun Chuen, access to roof top of the residential blocks and the school (which are the sensitive receivers as identified in the EIA Report) was being rejected by the property management. The monitoring location is therefore moved to the roof of a toilet block at Lai Chi Kok Park, which is considered a better location to reflect baseline situation as it is located closer to Ngong Shuen Chau Viaduct worksite and avoid measuring construction noise generated from Site 6 and Site 10 construction. For Stonecutters Island, the Security Bureau has rejected our access request to Stonecutters Military Base to carry out baseline monitoring. An alternative location at the DSD Pumping Station close to Stonecutters Military Base was therefore chosen for the purpose of carrying out the baseline monitoring.

Baseline TSP and noise monitoring were not carried out at Site 6, Site 10 and CDA Site as Site 6 and 10 were currently under construction and the CDA Site was not yet occupied. However, the ambient air quality and noise conditions would be reviewed upon completion of Site 6, Site 10 and West Rail construction works which might significantly alter the background conditions. A repeat of the baseline monitoring, if the situation warrants, would be carried out at the above locations to obtain updated baseline levels.

Both 24-hour and 1-hour TSP monitoring were completed at the two locations for 14 consecutive days, between 1 - 14 June 2002. The average 24-hour and 1-hour TSP levels at all locations were in the range of 32 to 168 $\mu\text{g}/\text{m}^3$ and 34 to 222 $\mu\text{g}/\text{m}^3$ respectively.

The baseline noise level monitoring was conducted between 1 - 19 of June 2002, except monitoring on 6 (mid-night), 9 and 11 June 2002 which were rescheduled due to rain. At Mei Foo Sun Chuen, the electricity supply to the noise monitoring equipment was suspended from 9:00 am on 3 June 2002 to 10:30 am on 4 June 2002, therefore results were not available during these time periods. The baseline noise level for the two locations was measured continuously for 24 hours during the monitoring period. During day-time period, the mean noise levels $L_{\text{eq}(30 \text{ minutes})}$ at all locations were in the range of 71-75 dB(A). During the evening time & holidays and the night-time periods, the mean noise levels $L_{\text{eq}(5 \text{ minutes})}$ at all locations were in the range of 65-72 dB(A) and 62-68 dB(A) respectively. The results were steady throughout the baseline monitoring period.

A weather station has been setup at the Chief Resident Engineer (CRE) temporary accommodation located at West Kowloon Reclamation near Stonecutters Island to measure the temperature, barometer pressure, wind speed and wind direction.

Data collected was reviewed and analyzed to establish the Action and Limit Levels for dust during impact/compliance monitoring throughout the construction and operation of the project. Details of the methodology, locations and results are presented in this report.

1. INTRODUCTION

ERM-Hong Kong Limited was appointed by the Highways Department to undertake the role of the Environmental Team Leader for the “Route 9 between Tsing Yi and Cheung Sha Wan – Ngong Shuen Chau Viaduct” to carry out baseline and impact monitoring for the project. Prior to the commencement of the construction activities, baseline monitoring of air and noise levels in accordance with the Environmental Permit (No. EP-085/2000/A) and the Environmental Monitoring and Audit Manual for the captioned works was required. ERM has also undertaken the baseline noise and air environmental monitoring in June 2002.

1.1 Purpose of the Report

The purpose of this report is to set out baseline levels for air quality and noise. These baseline levels will be used as the basis for environmental impact and compliance monitoring during construction. This report presents the monitoring locations, equipment, period, methodology, results and observations of the air and noise measurements undertaken during the baseline period.

1.2 Background

Ove Arup and Partners Hong Kong Ltd (Arup) has been awarded the Design and Construction Consultancy Assignment “Agreement No. CE72/98 R9T between Tsing Yi and Cheung Sha Wan.” The main elements of the Works which are to be designed and constructed under the Assignment are outlined with the overall objectives as follows:

- Complete Phase 1 of the Works, comprising the Ngong Shuen Chau Viaduct and its link with CT8, R9T Cheung Sha Wan – Shatin and West Kowloon Highway, by December 2006.
- Complete Phase 2a and 2b of the Works, comprising viaducts in East & West Tsing Yi, the Nam Wan Tunnel, links with the Stonecutters Bridge and Cheung Tsing Highway, and the ramps linking CT9 with Stonecutters Bridge and Nam Wan Tunnel, by Dec 2007.

Phase 1 of the project, “HY/2000/21 – Route 9 Ngong Shuen Chau Viaduct” has been awarded to China Harbour Engineering Company (Group) on 10 April 2002. It is not anticipated that Phase 2a and 2b would commence before the first quarter of 2003 as the relevant contracts have not been tendered and awarded. This baseline monitoring report will concentrate on the Phase 1 Contract.

The sensitive receivers are mainly residential areas and schools at Mei Foo Sun Chuen, and the dwellings at Stonecutters Military Base. In selecting the monitoring station at Mei Foo Sun Chuen, considerations are given to the proximity of the sensitive receivers, the convenience of access and the potential disturbance to the residents at Mei Foo Sun Chuen. The roof of the toilet block in the Lai Chi Kok Park at Mei Foo Sun Chuen was chosen instead of the roof of the residential block or school building because access to these locations was being rejected by the property management. Moreover, the roof of toilet block located within Lai Chi Kok Park was considered as a better location as it has secured access, power supply and minimal disturbance to the residents, and it is closer to the Ngong Shuen Chau worksite.

The sensitive receivers at Stonecutters Island are within the military base. It is confirmed by Security Bureau that access would not be allowed to obtain noise and air samples. An alternative location (DSD Pumping Station) near the Stonecutters military base has been identified as the monitoring station.

Three other potential noise and dust sensitive receivers: Site 6, Site 10 and CDA Site were identified in the EM&A Manual but monitoring works were not carried out as Site 6 and 10 were currently under construction and the CDA Site was not occupied. However, the ambient air quality and noise conditions would be reviewed upon completion of Site 6, Site 10 and West Rail construction works which might significantly alter the background conditions. A repeat of the baseline monitoring, if the situation warrants, would be carried out at the above locations to obtain updated baseline levels. Impact monitoring will also be carried out at these locations when these sites are ready.

1.3 Structure of the Baseline Monitoring Report

The structure of the report is as follows:

- Section 1: Introduction, which details the purpose and structure of the report.
- Section 2: Air Quality, which describes the baseline air monitoring.
- Section 3: Noise, which describes the baseline noise monitoring.
- Section 4: Conclusions

2. AIR QUALITY

2.1 Monitoring Requirements

In accordance with the EM&A Manual, baseline air monitoring was conducted for a period of fourteen consecutive days, in terms of 24-hour TSP, at the designated monitoring stations. The sampling of 1-hour TSP was also carried out for seven times at each designated stations when the highest dust impact was expected.

2.2 Monitoring Equipment

Continuous 24-hour TSP air quality monitoring was performed using a TE-5170 Tisch Environmental Inc. High Volume Sampler (HVS) located at each of the designated monitoring stations. The HVS was also used to carry out the 1-hour TSP monitoring. Table 2.1 summarises the equipment used in the baseline dust monitoring programme. A copy of the calibration certificate for the HVS is attached in Appendix A.

Table 2.1 Air Quality Monitoring Equipment

Equipment	Model and Make	Qty.
HVS Sampler	TE-5170 Tisch Environmental Inc.	2
Calibrator	TE-5028A Tisch Environmental Inc.	1

2.3 Monitoring Parameters, Frequency and Duration

Table 2.2 summarises the monitoring parameters, monitoring period and frequencies of baseline dust monitoring.

Table 2.2 Baseline Dust Monitoring Period

Monitoring Stations	Parameter	Period	Frequency
ASR1, ASR2	1-hour TSP	0700-1900	Once/2 days
	24 hr. TSP	00-24 hrs.	Daily

2.4 Monitoring Locations

In accordance with the EM&A Manual and project specifications, two designated air quality monitoring locations were selected. All monitoring (both 1-hour TSP and 24-hour TSP) were performed in June 2002. The monitoring periods for each station are summarised in Table 2.3. Permissions to conduct 24-hour and 1-hour TSP at ASR1 and ASR2 were granted in May 2002 by LCSD and DSD respectively. Baseline 24-hour and 1-hour TSP monitoring at ASR1 and ASR2 were commenced on 1 June 2002 and completed on 14 June 2002. The monitoring locations are shown in Figure 1a.

Table 2.3 Exact Monitoring Periods for the Monitoring Stations

Location	Monitoring Period	
	1-hour TSP	24-hour TSP
Lai Chi Kok Park at Mei Foo Shun Chuen (ASR1)	1/6/02 – 14/6/02 (inclusive)	1/6/02 – 14/6/02 (inclusive)
DSD Pumping Station at Stonecutters Island (ASR2)	1/6/02 – 14/6/02 (inclusive)	1/6/02 – 14/6/02 (inclusive)

2.5 Monitoring Methodology and QA/QC Procedure

Instrumentation

High volume (Hi-Vol) samplers (Model TE-5170 Tisch Environmental Inc.) complete with the appropriate sampling inlets were used for both 24-hour and 1-hour TSP sampling. The sampler is composed of a motor, filter holder, flow controller and a sampling inlet and its performance specification complies with the requirement of the USEPA Standard Title 40, Code of Federation Regulations Chapter 1 (Part 50).

Calibration Procedures

- Calibration procedures of HVS were as follows:
- A certified orifice transfer standard with a calibration curve was used for the calibration.
- The transfer standard was connected to the inlet of the sampler. The orifice manometer was then connected to the orifice pressure port. The manometer's connecting tubing was inspected to make sure that there are no leaks between the orifice unit and the sampler.
- The motor was then disconnected from the flow controller and plugged directly to an AC power source.

- A weather station has been setup at the CRE Temporary Accommodation to measure and record the ambient temperature, T_a (K) and the barometer pressure P_a (mmHg) during calculation.
- The sampler was allowed to run for at least 2 minutes to re-establish the run temperature conditions. The pressure drop across the orifice and the well-type manometer reading was recorded during calibration. The variable resistance was adjusted to repeat recording for four different flow rates.
- The best fit straight line was determined by linear regression and find the slope (m_1), intercept (b_1) and correlation coefficient (r).

Operating/Analytical Procedures

- The flow rate of the high volume sampler was set to about $1.1 \text{ m}^3/\text{min}$ - $1.7 \text{ m}^3/\text{min}$ prior to commencement of the dust sampling in accordance with the manufacturer's instruction to within the range recommended in USEPA Standard Title 40, CFR Part 50.
- The samplers was located such that:
 - the filter was about 1.3 meters above ground.
 - it was greater than 20 meters away from trees.
 - it was separated from any obstacle by at least twice the height of the obstacle protruding above the sampler.
 - it has unrestricted airflow 270° around the sampler.
- Fibreglass filters were used for TSP sampling (G810) [Note: these filters have a collection efficiency of $> 99\%$ for particles of 0.3 mm diameter].
- All filters were equilibrated in the conditioning environment for 24 hours before weighing. The conditioning environment temperature was between 25°C and 30°C and not vary by more than $\pm 3^\circ\text{C}$; the relative humidity was $< 50\%$ and not vary by more than $\pm 5\%$.
- A new filter was placed with stamped number upward on a supporting screen.
- The filter was properly aligned on the screen so that the gasket formed an air-tight seal on the outer edges of the filter.
- Shelter lid closed and catch secured with the aluminium strip.
- The samplers was then allowed to run for at least 5 minutes to establish run-temperature conditions.
- The flow indicator reading was recorded and the sampler flow rate was determined.

- The programmable timer was set and the starting sampling time, weather condition and the filter number was recorded.
- At the end of sampling, the filter was transferred from the filter holder of the HVS to a sealable plastic bag and sent to the laboratory for weighing. The elapsed time was also recorded.
- Before weighing, all filters were equilibrated in a desiccator for 24 hours with temperature of $25^{\circ}\text{C}\pm 3^{\circ}\text{C}$ and the relative humidity (RH) $50\%\pm 5\%$, preferably 40%.

Maintenance

- The volume sampler and their accessories were maintained in good working condition, include replacing motor brushes routinely and checking electrical wiring to ensure continuous power supply.
- The high volume samplers was calibrated at bi-monthly intervals using TE-5028A Tisch Environmental Inc. Calibration Kit throughout all stages of the air quality monitoring.

2.6 Results And Observations

2.6.1 Results

Baseline air quality monitoring was conducted at ASR1 and ASR2. The monitoring data are summarised in Tables 2.4 and 2.5. Graphical presentations of the 24-hour TSP and 1-hr TSP results are shown in Figures 2 to 5. The detailed monitoring data of 24-hour and 1-hour TSP are presented in Appendices B1 and B2 respectively. Detailed weather condition at the monitoring locations during the baseline monitoring period is shown in Appendix D.

Table 2.4 Summary of 24-hour TSP Monitoring Results

Monitoring Location	Average TSP Concentration $\mu\text{g}/\text{m}^3$
	(Range)
ASR1	50
	32 – 92
ASR2	74
	32 – 168

Table 2.5 Summary of 1-hour TSP Monitoring Results

Monitoring Location	Average TSP Concentration $\mu\text{g}/\text{m}^3$
	(Range)
ASR1	104
	34 – 122
ASR2	114
	38 – 222

2.6.2 Observations

The weather was generally fine during the monitoring periods except occasion raining on 6 June 2002 (around midnight) and heavy rain on 9 and 11 June 2002. For Lai Chi Kok Park at Mei Foo Sun Chuen (ASR1), no significant dust source was identified during the monitoring periods. The major dust source at DSD Pumping Station at Stonecutters Island (ASR2) was identified as the vehicle emission of container vehicles.

At dust monitoring station ASR1 and ASR2, air quality monitoring for 1-hour TSP and 24-hour TSP were conducted during 1 – 14 June 2002. The monitoring was conducted after the commencement of the advanced works in the construction site: site clearance and establishment of temporary Engineer's and Contractor's accommodation (containers), which were performed in April. No dust generating construction work was undertaken during the monitoring period.

2.7 Action and Limit Levels

The Action and Limit levels have been set in compliance with the Environmental Monitoring and Audit Manual, which states the following:

Table 2.6 Action and Limit Levels for Air Quality

Parameters	Action	Limit
24 hour TSP Level in $\mu\text{g}/\text{m}^3$	<ul style="list-style-type: none"> For baseline level $\leq 200 \mu\text{g}/\text{m}^3$, Action level = (Baseline level * 1.3 + Limit level)/2 For baseline level $> 200 \mu\text{g}/\text{m}^3$, Action level = Limit level 	260
1 hour TSP Level in $\mu\text{g}/\text{m}^3$	<ul style="list-style-type: none"> For baseline level $\leq 384 \mu\text{g}/\text{m}^3$, Action level = (Baseline level * 1.3 + Limit level)/2 For baseline level $> 384 \mu\text{g}/\text{m}^3$, Action level = Limit level 	500

Following these criteria, the Action and Limit levels for dust have been set as follow:

Table 2.7 Action and Limit Levels for 24-Hour TSP

Location	Action Level ($\mu\text{g}/\text{m}^3$)	Limit Level ($\mu\text{g}/\text{m}^3$)
ASR1	163	260
ASR2	178	260

Table 2.8 Action and Limit Levels for 1-Hour TSP

Location	Action Level ($\mu\text{g}/\text{m}^3$)	Limit Level ($\mu\text{g}/\text{m}^3$)
ASR1	318	500
ASR2	324	500

3. NOISE

3.1 Monitoring Requirements

Baseline noise monitoring was conducted continuously for a period of 14 consecutive days at two monitoring locations according to the specifications in the EM&A Manual. Monitoring was commenced on 1 June 2002 and completed on 19 June 2002.

3.2 Monitoring Equipment

Integrating Sound Level Meters were used for noise monitoring. They were Type 1 sound level meters capable of giving a continuous readout of the noise level readings including equivalent continuous sound pressure level (L_{eq}) and percentile sound pressure level (L_x). They comply with International Electrotechnical Commission Publications 651:1979 (Type 1) and 804:1985 (Type 1). Also, a portable electronic wind speed indicator capable of measuring wind speed in m/s was used to monitor the wind speed. Table 3.1 summarised the noise monitoring equipment model being used

Table 3.1 Noise Monitoring Equipment

Equipment	Model
Integrating Sound Level Meter	SC-30, CESVA
Calibrator	CB-5, CESVA
Portable Wind Speed Indicator	PWM1, Dwyer

3.3 Monitoring Parameters, Frequency and Duration

Baseline noise for the A-weighted levels L_{eq} , L_{10} and L_{90} were recorded at 5-minute intervals. Data obtained from the baseline noise monitoring was processed and presented according to the following three periods:

- Daytime: 0700-1900 hrs on normal weekdays
- Evening-time: 1900-2300 hrs on all normal weekdays; and 0700-2300 hrs on holidays
- Night-time: 2300-0700 hrs of next day

The frequencies and parameters of noise measurement are presented in Table 3.2.

Table 3.2 Frequency and Parameters of Noise Monitoring

Time Period	Duration / min.	Parameters
Daytime: 0700-1900 hrs on normal weekdays	30 (average of 6 consecutive $L_{eq}(5min)$)	L_{eq} , L_{90} & L_{10}
Evening-time: 0700-2300 hrs on holidays; and 1900-2300 hrs on all other days	5	L_{eq} , L_{90} & L_{10}
Night-time: 2300-0700 hrs of next day	5	L_{eq} , L_{90} & L_{10}

3.4 Monitoring Locations

In accordance with the EM&A Manual and project specifications, 2 designated monitoring stations (as shown in Figure 1b) were selected for noise measurements. Table 3.3 describes the locations of the noise monitoring stations.

Table 3.3 Location of the Noise Monitoring Stations

Location I.D.	Description	Type of measurement
NSR1	Roof of Toilet Block of Lai Chi Kok Park at Mei Foo Sun Chuen	Free Field
NSR2	DSD Pumping Station at Stonecutters Island	Free Field

3.5 Monitoring Procedures

3.5.1 Field Monitoring

- The microphone of the Sound Level Meter (with weatherproof kit) was mounted on a tripod at a height of at least 2m above ground level.
- The meter was positioned away from any nearby reflective surfaces.
- AC power supply was checked to ensure good functioning of the meter.
- Parameters such as frequency weighting, the time weighting and the measurement time were set as follows:
 - frequency weighting : A
 - time weighting : Fast
 - time measurement : 30 minutes / 5 minutes
- Prior to and after each noise measurement, the meter was calibrated using the Calibrator for 94 dB at 1000 Hz.
- The wind speed was frequently checked with the portable wind meter.

- At the end of the monitoring period, the L_{eq} , L_{90} and L_{10} were recorded. In addition, site conditions and noise sources were recorded on a standard record sheet.
- Noise measurement was paused during periods of high intrusive noise if possible and observation was recorded when intrusive noise was not avoided.
- Noise data collected during the operation of hand-held breaker in the LCSD Park was excluded from the mean noise level calculation.
- Noise monitoring was cancelled in the presence of rain.

3.5.2 Maintenance and Calibration

- The microphone head of the sound level meter and calibrator will be cleaned with a soft cloth at quarterly intervals.
- The meter will be sent to the supplier to check and calibrate at yearly intervals.

3.6 Results And Observations

3.6.1 Results

Baseline noise monitoring was conducted between 1 – 19 June 2002. The monitoring results are summarised in Tables 3.4 - 3.6. Graphical presentations of baseline noise monitoring at daytime, evening-time and night-time are provided in Figures 6 - 11. All detailed baseline noise monitoring data are given in Appendix C1 and C2. Detailed weather condition at the monitoring locations during the baseline monitoring period is shown in Appendix D.

Table 3.4 Summary of Day-Time Noise Monitoring Results

Daytime 0700-1900 hrs on normal weekdays	Mean Noise Level, dB(A) (Range)		
	L_{eq}	L_{10}	L_{90}
NSR1	70	73	67
	64-84	65-89	62-74
NSR2	75	77	69
	69-78	71-82	63-72

Table 3.5 Summary of Evening-Time Noise Monitoring Results

Evening-time 0700-2300 hrs on holidays; and 1900-2300 hrs on all other days	Mean Noise Level, dB(A) (Range)		
	L_{eq}	L_{10}	L_{90}
NSR1	65	66	63
	61-71	62-73	59-70
NSR2	72	75	66
	63-78	66-80	58-72

Table 3.6 Summary of Night-Time Noise Monitoring Results

Night-time 2300-0700 hrs of next day	Mean Noise Level, dB(A)		
	(Range)		
	Leq	L ₁₀	L ₉₀
NSR1	62	63	61
	57-69	58-72	56-65
NSR2	68	71	62
	58-75	59-79	56-71

3.6.2 Observations

The weather during the monitoring period was generally fine except raining on 6 (midnight), 9 and 12 June 2002 where noise monitoring was postponed. All the monitoring was conducted when there was no high intrusive noise and the average wind speed was below 5 m/s and gust wind speed was below 10m/s. There was no construction activity within the contract construction site. However, construction works were identified at Mei Foo Sun Chuen. The major noise sources at Mei Foo Sun Chuen (NSR1) during the daytime were construction noise from West Rail Construction Contracts, piling works at Site 10 and minor construction noise from Lai Chi Kok Park (use of backhoe and handheld breaker). In particular, handheld breaker had been used in Lai Chi Kok Park on 4 and 8 June 2002 during daytime. These results were discarded in the calculation of the mean noise level. As for Stonecutters Island (NSR2), the major noise source during the daytime was the traffic noise generated by high volume of container trucks.

For evening time, baseline noise level at the Lai Chi Kok Park was moderate (around 65 dB(A)). Baseline noise level at the DSD Pumping Station was high (around 72 dB(A)). The major noise sources were noise from human activities and insects at the Lai Chi Kok Park (NSR1) and traffic and insects at DSD Pumping Station (NSR2).

As for night time, the baseline noise level at the two locations was high (around 62 dB(A) at Lai Chi Kok Park and around 68 dB(A) for DSD Pumping Station). The major noise sources at NSR1 were identified as noise from human activities and for NSR2, the major noise sources were from insects and traffic.

As the Environmental and Audit Manual has identified that the “background noise sources in the study area are currently dominated by construction and industrial activity”, it is justified that the baseline results are on the high side. It is therefore concluded that the results obtained from the baseline monitoring well represented the baseline conditions.

3.7 Action And Limit Levels

The Action and Limit Levels (AL Levels) were established in accordance with the EM&A Manual. The baseline noise level will act as a basis for the correction to the impact noise monitoring. Table 3.7 presents the AL levels for construction noise.

Table 3.7 Action and Limit Levels for Construction Noise

Time Period	Action	Limit
0700-1900 hrs on normal weekdays	When one documented complaint is received	75dB(A)*
0700-2300 hrs on holidays; and 1900-2300 hrs on all other days	When one documented complaint is received	70 dB(A)
2300-0700 hrs of next day	When one documented complaint is received	55 dB(A)

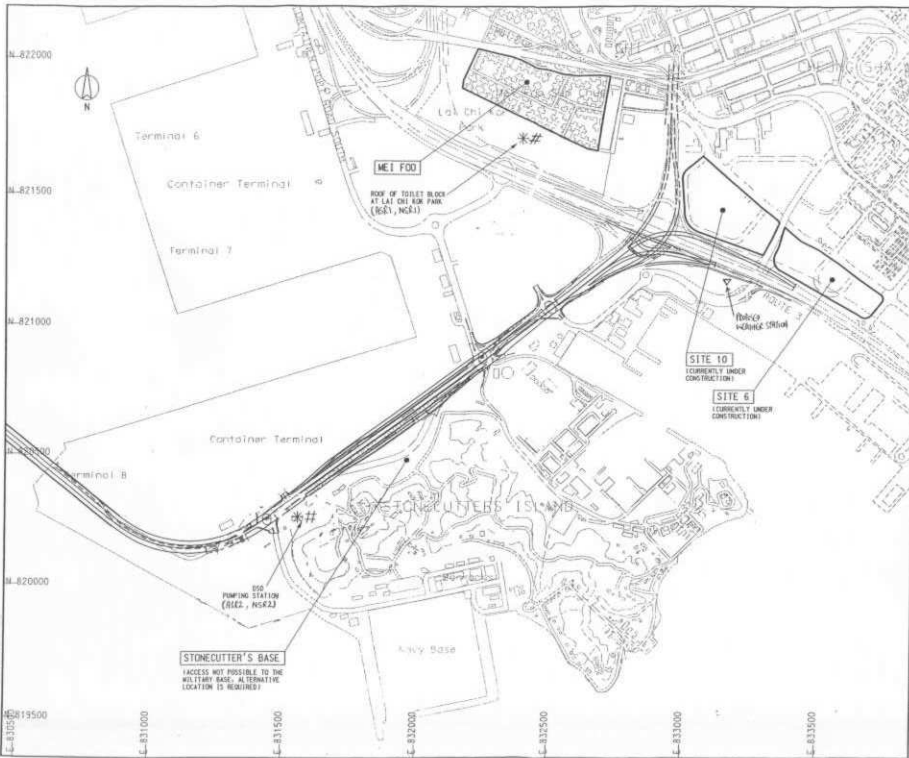

* Reduce to 70 dB(A) for schools and 65 dB(A) during school examination periods.

4. CONCLUSIONS

The baseline noise level monitoring was conducted between 1 and 19 June 2002. The baseline 24-hour and 1-hour Total Suspended Particulates (TSP) monitoring was carried out during 1 to 14 June 2002.

The results for ambient dust level obtained from the monitoring were steady and within the Limit Level. The noise monitoring results were close to the Limit Level due to non-Route 9 related construction and industrial activities within the area. The monitoring results have been used to establish the Action and Limit Levels for the relevant parameters of the Route 9 Ngong Shuen Chau Viaduct Contract for impact/compliance monitoring. It is concluded that the results well represented the baseline conditions for Ngong Shuen Chau Viaduct Contract.

Appendices

Appendix A1
Calibration Certificates for the HVS

Calibration Date	31-May-02	Next Calibration Date	31-Jul-02
Station	ASR1	Equipment no.	E.HVS.01

Ambient Condition			
Temperature, Ta (K)	301.0	Pressure, Pa (mmHg)	752.6

Orifice Transfer Standard Information			
Equipment no.	E.CAL.01	Intercept, co	-0.00514
Slope, mo	1.5507	Next Calibration Date	7-May-03
Last Calibration Date	7-May-02		
$mo \times Q_{std} + co = [\Delta O \times (Pa/760) \times (298/Ta)]^{1/2}$ $Q_{std} = \{[\Delta O \times (Pa/760) \times (298/Ta)]^{1/2} - co\} / mo$			

Calibration Point	Orifice Manometer Reading, ΔO (inch)	Orifice Q_{std} (CMM) x-axis	HVS Manometer Reading, ΔH (inch)	$[\Delta H \times (Pa/760) \times (298/Ta)]^{1/2}$ y-axis
1	7.7	1.78	7.9	2.78
2	6.6	1.64	6.9	2.60
3	5.6	1.51	6.0	2.43
4	4.7	1.39	5.1	2.24
5	3.6	1.21	4.0	1.98

By Liner Regression of y on x

Slope, mh = 1.4325 Intercept, ch = 0.2462

*Correction Coefficient, R = 0.9998

Calibration Result: ACCEPT

* If the Correlation Coefficient, R is < 0.9900. Checking and Recalibration are require.

Remark: _____

DATA TABULATION

Vstd	(x axis) Qstd	(y axis)	Va	(x axis) Qa	(y axis)
1.0005	0.7915	1.2285	0.9944	0.7867	0.7646
0.9967	1.0318	1.5860	0.9906	1.0255	0.9871
0.9948	1.1267	1.7374	0.9888	1.1198	1.0813
0.9931	1.2096	1.8766	0.9870	1.2022	1.1679
0.9837	1.5867	2.4570	0.9777	1.5770	1.5291
Qstd slope (m) = 1.55070			Qa slope (m) = 0.97102		
intercept (b) = -0.00514			intercept (b) = -0.00320		
coefficient (r) = 0.99978			coefficient (r) = 0.99978		
y axis = SQRT[H2O(Pa/760)(298/Ta)]			y axis = SQRT[H2O(Ta/Pa)]		

CALCULATIONS

Vstd = Diff. Vol [(Pa-Diff. Hg)/760] (298/Ta)
 Qstd = Vstd/Time

Va = Diff Vol [(Pa-Diff Hg)/Pa]
 Qa = Va/Time

For subsequent flow rate calculations:

Qstd = 1/m{ [SQRT(H2O(Pa/760)(298/Ta))] - b }
 Qa = 1/m{ [SQRT H2O(Ta/Pa)] - b }

Geräte-Typ Model type Type d'instrument	8352.00
Modell Model Modèle	Wind sensor for speed and direction
Anzahl number nombre	1
Genauigkeit Accuracy Précision	Speed: $\pm 0,5$ m/s or 3% Direction $\pm 5^\circ$

Hiermit bescheinigen wir, daß dieses LUFFT-Erzeugnis in Übereinstimmung mit dem QM-Handbuch der LUFFT Mess- und Regeltechnik GmbH nach DIN EN ISO 9001 gefertigt wurde. Die Bestellvorgaben wurden eingehalten. Die Ausführung und Anzeigegenauigkeit der Geräte / Systeme wurde im Rahmen der LUFFT-Qualitätssicherungsmaßnahmen überwacht. Die Qualitätsprüfung ergab keine Beanstandung.

This is to certify, that this Lufft product has been tested according to the TQM of the LUFFT Mess- und Regeltechnik GmbH manual in accordance with DIN EN ISO 9001. Ordering specifications are complied with. Execution of instruments / systems as well as testing of accuracy was carried out following LUFFT quality assurance procedures. Quality inspection was successfully passed.

Par ce document, nous certifions que le produit correspondant a bien été testé suivant les normes TQM de Lufft Mess- und Regeltechnik GmbH en accord avec la norme DIN EN ISO 9001. Les conditions stipulées dans la commande ont été remplies. La réalisation des appareils / systèmes ainsi que les tests de précision ont été fait en concordance avec les procédés de qualité Lufft.

TEST REPORT

APPLICANT: Environmental Resources Management
21/F Lincoln House,
979 King's Road,
Taikoo Place,
Island East, Hong Kong

Laboratory No.: D/02/01234
Date of Issue: 2002-06-05
Date Received: 2002-06-04
Date Tested: 2002-06-04
Date Completed: 2002-06-05

TTN: Mr. Richard Kwan

Page: 1 of 1

Sample Description 7 samples submitted by the client said to be TSP Glass-fibre filter

Filter Type : P/N - G810
Size : 20.3 x 25.4 cm

Name of Site : Route 9 - Ngong Shuen Chau

Project No. : HY/2000/21

Sampling Date: 2002-06-03

Test Requested: Weight determination of filter paper by gravimetric method.

Methodology: WL/ENV/025

Results:

Filter ID	Initial Weight, g	Final Weight, g	Particulate Weight, g
020528/T/001	2.7582	2.9793	0.2211
020528/T/002	2.7680	2.7764	0.0084
020528/T/003	2.7470	2.9313	0.1843
020528/T/004	2.7387	2.7445	0.0058
020528/T/005	2.7551	2.8396	0.0845
