EXECUTIVE SUMMARY

This serves as part of the Environmental Monitoring and Audit (EM&A) Report for the Ngong Ping Sewage Treatment Works at Ngong Ping, Lantau Island, operated by Sewage Treatment Division 2 of Drainage Services Department (ST2, DSD). This report contains the results of the sixth quarterly odour impact monitoring conducted by the Environmental Team (ET).

There were no breaches in odour action and limit levels and the odour mitigation measures at the sewage treatment works were performing adequately. Thus, the environmental protection was in compliance with the regulations. No complaints were received in the period.

1. Introduction

This is the sixth Odour Impact Environmental Monitoring and Audit (EM&A) Report for Ngong Ping Sewage Treatment Works (STW) at Ngong Ping, Lantau Island, operated by Sewage Treatment Division 2 of Drainage Services Department (ST2, DSD). This report presents the results of odour monitoring in the month of August 2007 and has been prepared by the Environmental Team of ST2, DSD.

Odour monitoring and the mitigation measures during operation of the sewage treatment works are carried out as recommended in the EM&A Manual.

The contact information for the key environmental personnel and the site location of Ngong Ping STW are shown in appendices 1 and 2, respectively.

2. Status of Environmental Protection

The EM&A Manual has stated that there would be potential odour impacts associated with the operation of the sewage treatment plant and recommended mitigation measures during the operation phase. As a result all the major odour sources within the proposed STW namely the inlet work, the sequencing batch reactors, the sludge thickeners, and the emergency storage tank are all contained by building structures and ventilated to centralised deodorisation units.

Prior to the operation of the odour generating activities, H₂S (hydrogen sulfide) measurements had been carried out at the site boundary and at nearby ASR's. This established the averaged baseline H₂S concentration conditions at each measurement position at the site boundary and at nearby ASR's. These baseline H₂S concentrations had been used to set the action levels of the odour EM&A program. Low H₂S concentrations at the monitoring locations were reported in the baseline study. No noticeable impact was found near the monitoring stations, thus their findings could be used as background indicator at Ngong Ping Sewage Treatment Works.

3. EM&A requirements

The EM&A Manual originally recommended that the first set of odour monitoring at the site boundary, at selected ASRs, and at the exhaust of the centralised deodorisation units should consist of both odour sampling and H₂S measurement. Site location plan of Ngong Ping STW and its monitoring stations are shown as appendix 2. Sampling at these locations using olfactometry and an H₂S analyser should be carried out simultaneously. The purpose is to establish the correlations between odour level (OUm⁻³) and H₂S concentration for each measurement position. As the first set of odour sampling/monitoring is fundamentally to establish the correlation between OUm⁻³ and

H₂S, the timing of this event should be selected during the summer period, as far as possible, to capture the highest odour concentrations. Once the correlation between H₂S concentrations and odour units is established, H₂S monitoring should be continued during the subsequent odour monitoring and H₂S concentrations measured should be converted to equivalent odour units.

However, both H₂S concentration and odour units at the designated locations were considered to be at trace level during baseline odour monitoring and hence it was found difficult to determine their correlation. According to the recommendation from EPD, there was no objection to correlate H₂S concentration with odour unit by the odour threshold in principle i.e. a H₂S concentration 0.00047ppm or 0.00066mg/m³ is equivalent to 1 odour unit. Therefore, only H₂S measurements were required to be carried out during baseline odour monitoring. As a result, the Action and Limit Levels of odour level were determined by calculation through the correlation of H₂S concentration and odour unit. Following the criteria set out in the EM&A Manual, the Action and Limit Levels for Operational Phase Odour Monitoring was derived and illustrated in Table 1:

Table 1 Action and Limit Levels for Operational Phase Odour Monitoring

Location of	Parameters	Action Level	Limit Level

With reference to the baseline odour monitoring report (ref: ENA50302), only H_2S measurements were taken at the seven designated monitoring stations locating at the site boundary, at selected ASR's and at the exhaust of the centralised deodorisation units during the first odour impact monitoring.

Apart from odour impact monitoring, regular odour patrolling in the vicinity of the STW would also be conducted in a monthly interval during the operational phase.

4. Implementation Status

All the major odour sources within Ngong Ping STW, namely the inlet work, the sequencing batch reactors, the sludge thickeners, and the emergency storage tank, are all building-contained facilities thus minimising direct emission of odour to the atmosphere. All odour emissions from these facilities mentioned above ventilated to centralised deodorisation units. A backup deodorisation unit was installed to provide buffer for maintenance or breakdown of the main deodorisation unit.

All the sludge generated from the STW will be dewatered onsite to more than 30% dry solids content before transporting to the designated landfill site for disposal and will be stored in covered container along the transporting route to avoid the possible odour impact on nearby sensitive receivers. The transportation of the sludge by sea to the disposal location is recommended, as far as practicable, in order to reduce potential air quality impacts from road transportation. Since the volume of influent into the STW has been low, significant amount of sludge has yet to be produced for transport to landfill.

The STW was designed for a daily flow of 2000 m^3 . An average daily inflow of 451 m^3 was recorded for the month of August 2007.

5. Monitoring Results

H₂S concentration (in parts per billion or in parts per million) were measured at seven designated stations as follows:

Monitoring	Level of	Location descirption
station	monitoring	
D1	1.0 m	STW site entrance
D2	1.0 m	Exhaust point of deodorisation room no. 2
D3	1.0 m	Sludge thickeners
D4	1.0 m	Deodorisation room no. 1 side facing east
D5	1.0 m	Cabe car terminal
D6	1.0 m	Public transport interchange
D7	1.0 m	Exhaust point of deodorisation room no. 1

As stipulated by the EM&A Manual, H₂S measurements were taken outside the premises of the identified ASR's (cable car terminal and public transport interchange) and these locations would not be influenced by other nearby odour sources. H₂S measurements were also undertaken at the site boundary downwind of the exhaust points of the deodorisation units and the covered odour sources.

A 15-minute measurement was taken every 3 hours for over a duration of 24 hours at each of the monitoring stations. The laboratory ALS Technichem (HK) Pty Ltd. undertook the measurement on 11-12 August 2007. Meteorological conditions including temperature, wind speed, wind direction and relative humidity were also measured at the time of the monitoring.

Concentrations of H_2S were measured using a Jerome H_2S Analyzers that utilises a gold film sensor for the detection of hydrogen sulfide. The instrument is capable of measuring H_2S concentrations in the range 1 ppb (1.4 μ g m⁻³) to 50 ppm (70 mg m⁻³) to an accuracy of $\pm 6\%$.

The laboratory report (including all data, map of monitoring stations, meteorological conditions) is attached as appendix 3. The odour impact monitoring results for August 2007 are summarized below:

Monitoring station	Average H ₂ S concentration (ppm)
D1	< 0.001
D2	< 0.001
D3	<0.001
D4	< 0.001
D5	< 0.001
D6	<0.001
D7	<0.001

According to the results, odour levels at the site boundary and at ASR's were below the Action Level. H_2S levels at the exhaust of the two centralised deodorisation units were also below the Action Level.

Odour patrols carried out on 21 June, 23 July and 21 August 2007 around the vicinity of Ngong Ping STW revealed no significant H₂S levels.

6. Summary of Complaints and Remedial Actions

No non-compliance and complaints were received.

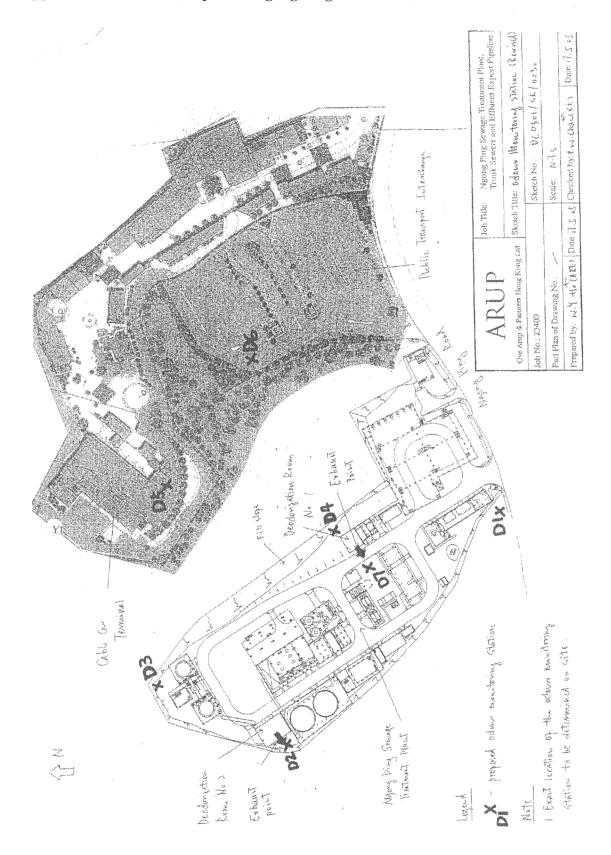

7. Conclusions and Comments

The required environmental protection work has been conducted. No remedial actions

were needed.

Certificate of Instrument Calibration

1912 W. 4th Street • Tempe, AZ 85281 • (602) 470-1414 • (800) 528-7411 • Fax (480) 804-0656 • www.azic.com Manufacturers of Computrac® Moisture Analyzers and Jerome® Toxic Gas Analyzers

Company

Guyline (Asia) Ltd

Address

Rm 1611 Eastern Harbour Ctr. 28 Hon

Hoi Chak Street

Quarry Bay

Hong Kong

This is to certify that the JEROME X631-0103 Gold Film Hydrogen Sulfide Analyzer, 220 VAC Serial Number 1824 with Sensor Number 05-10-7-Z6A, was calibrated with standard units traceable to NIST

Calibration Status as Received: Out of Calibration

Incoming:

Actual

Calibration Gas

Tolerance Specification

Level I

0.444

0.501 ppm H2S

0.476-0.526 (+/-5%) <3%

RSD Outgoing:

Mean @ Saturation

Calibration Gas

Relative Standard Deviation

.500

0.501 ppm H2S

Calibration Status as Left: In Calibration Estimated Uncertainty of Calibration: 3.5%

Ambient conditions during calibration:

Temperature degrees F: 69.6

% Relative Humidity: 39.8

Calibration Date: 5/22/2007

Re-Calibration Date: 5/20/2008

Date: 5/24/2007

Approved By: Name/Title:

Marlene Young - Vech Support/Quality Control

Equipment Used

Permeation Tube

S/N: 56-26546

Calibration Date:

12/12/2006

NIST: D3609-96

DynaCalibrator

Calibration Date Due: 12/12/2007 S/N: MU910

NIST: 255085,95;NBS Buret

Calibration Date:

7/14/2006

Calibration Date Due: 7/15/2007

#81 and #K10

Digital Multimeter

S/N: 515552

NIST: QA1323

Calibration Date:

7/13/2006

Calibration Date Due: 7/13/2007

Flowmeter

S/N: US04I26034

NIST: Teledyne 1477, 1556,

Calibration Date:

10/6/2006

Calibration Date Due: 10/7/2007

1560

Calibration Procedure Used: 3J09-0006

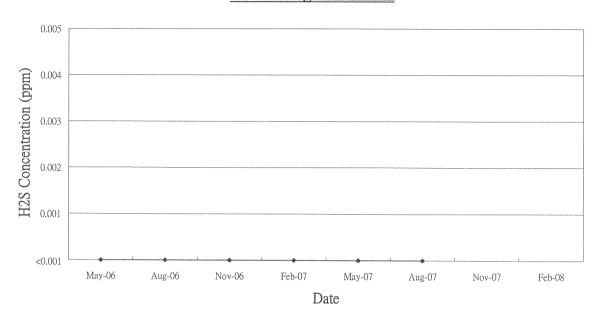

Arizma Instrument certifies that the above listed instrument meets or exceeds all published specifications and has been calibrated using standards whose accuracy is traceable to the NATIONAL INSTITUTE OF STANDARDS TECHNOLOGY within the finalizations of the institute's calibration services, or have been derived from accepted values of natural physical constants, or have been derived by the ratio type of self-calibration techniques. Arizona instrument has reviewed MIL STD 45662A and believes to comply.

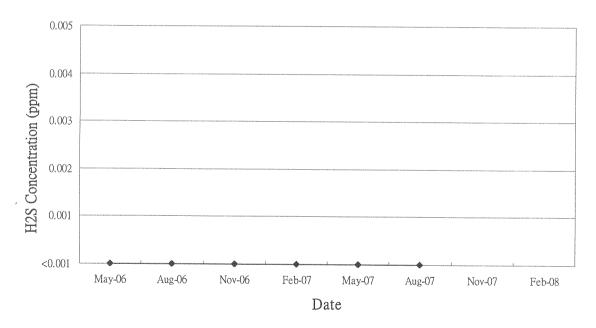

DISCLAIMER: Any unauthorized adjustments, removal or breaking of C/C seals, or other customer modifications on your Jerome Analyzer WILL VOID this factory calibration certification. Because any of the above acts could affect the calibration and readings of the instrument, their certificate will no longer be valid and, further, Arizona Instrument Corporation WILL NOT be responsible for any liabilities created as a result of using the instrument after such adjustments, scal removal, or modifications.

As long as a functional test is within range, according to the procedure outlined in the Operator's Manual, the instrument is performing correctly.
