EXECUTIVE SUMMARY

This is the thirteenth monthly Environmental Monitoring and Audit (EM&A) report for "Drainage Improvement in Southern Lantau Investigation". The environmental permit number is "EP-237/2005/A". The report concludes the impact monitoring for the activities undertaken during the period of 1st August 2009 to 31st August 2009. The major activities in this reporting month include excavation for pipe trench at Ling Tsui Tau, construction of box culverts, retaining wall at Pak Ngan Heung (PNH), construction of retaining wall at Tai Tei Tong (TTT) River and construction of gabion walls as well as retaining wall at Luk Tei Tong (LTT) River.

Noise, water quality and ecological monitoring were performed. Results obtained were checked against the previously established Action / Limit (A/L) levels. Additionally, the implementation status of environmental mitigation measures, event/ action plan and environmental complaint handling procedures were inspected during weekly site environmental audit.

In general, waste management was satisfactory during the reporting month.

Impact monitoring for construction noise was conducted in the reporting period. No exceedance of A/L level was reported.

Furthermore, impact monitoring for water quality was conducted. Total 89 non-compliance events of water quality criteria were recorded in this reporting period. Except the natural fluctuation and influence of adverse weather exceedances were mainly caused by site water discharge due to poor site conditions and influence of rainstorm.

During ecological monitoring survey, no White-shouldered Starling was recorded breeding in the watch tower. And there was no sign of disturbance from the Project to the watch tower, though the breeding season of White-shouldered Starling in this year has begun. The watch tower may not be suitable for birds as nesting habitat. In addition, no disturbance on the flora and fauna in the river channels were observed during the ecological monitoring. Non-compliance event regarding improper site water discharge was recorded in this reporting month. Contractor was seriously reminded to implement proper mitigation measures and remedial actions as to minimize water quality impacts due to construction works.

There was no complaint, notification of any summons and successful prosecutions against the project received during the reporting period.

Key construction activity in the coming month will be construction of box culvert and retaining wall at PNH, gabion walls at TTT River and retaining walls, gabion blocks as well as box culvert at LTT River. It is expected that noise, air and water quality impacts will be resulted from the works. With reference to the EM&A manual and mitigation measure report, mitigation measures are proposed to be taken, if necessary.

The ET will continue to implement the environmental monitoring & audit programme in accordance with the EM&A Manual and Environmental Permit requirement.

1. Introduction

This is the thirteenth monthly Environmental Monitoring and Audit (EM&A) Report for "Drainage Improvement in Southern Lantau Investigation" project (Environmental Permit No. EP-237/2005/A)

2. Project Information

2.1 Construction program

The "Drainage Improvement in Southern Lantau Investigation" project will be completed by January 2011. The project comprises the following:

- Construction of approximately 80m long gabion with natural bed in Pak Ngan Heung River, approximately 180m of three cells 3m x 2m box culvert and approximately 100m of rectangular channel at Pak Ngan Heung River;
- Construction of approximately 250m of 0.75m wide U-Channel at Ling Tsui Tau Village in Mui Wo;
- Construction of bypass channel of about 350m and 240m long of gabion channels at Luk Tei Tong River respectively; and
- Widening three existing bottlenecks with gabion lined at Tai Tei Tong River

Appendix A shows the construction program and location plan of the project.

2.2 Project Organization

The Main Contractor, Yick Hing Construction Company Limited, has commissioned Environmental Pioneers & Solutions Limited and Ecosystems Limited as the Environmental Team, which comprises the environmental team leader, the ecologists and the environmental technicians to undertake the environmental monitoring and audit work for this project.

The environmental management structure and is shown in Fig 2.2.1.

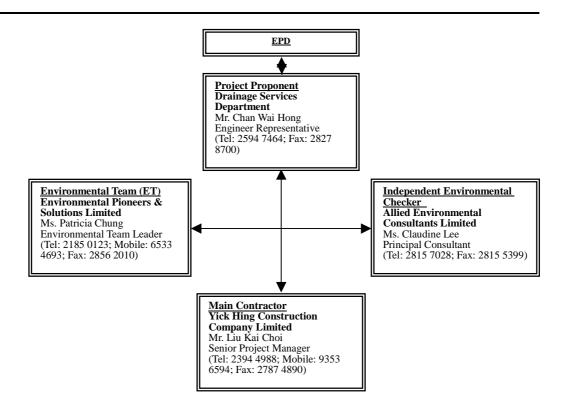

Figure. 2.2.1 Environmental Management structure for the project

2.3 Key Personal Contact information chart

Detailed contact of key persons involved in environmental aspect of the project is shown in Appendix B.

3. Construction Stage

3.1 Construction Activities in the reporting month

Major activities in the reporting month included the followings:

- 1. Construction of box culverts BC5 to 8 at PNH;
- 2. Construction of retaining wall D at PNH River;
- 3. Construction of box culvert A at LTT
- 4. Construction of gabion wall at bottleneck B of TTT River;
- 5. Construction of pipe trench along Ling Tsui Tau;
- 6. Construction of gabion wall (near Yuen's Compound) at LTT River; and
- 7. Construction of retaining wall J (near Yuen's Compound) at LTT River.

3.2 Construction Activities for the coming month

Key Construction works in the coming month will include:

- 1. Finishing works for box culverts BC5 to 8 at PNH;
- 2. Construction of retaining wall D at PNH River;
- 3. Construction of box culvert A at LTT;
- 4. Construction of gabion blocks at bottleneck B of TTT River;
- 5. Construction of pipe trench along Ling Tsui Tau;
- 6. Construction of gabion wall (near mangrove area) along LTT River; and
- 7. Construction of retaining wall J (near Yuen's Compound) at LTT River.

3.3 Environmental Status

Appendix A shows the drawing of the project area.

Locations of the monitoring and control stations with environmental sensitive receivers are presented in Section 4.3, 5.3 and 6.3 for noise, water and ecological monitoring respectively.

4. Noise Monitoring

4.1 Monitoring Parameters and Methodology

The construction noise level was measured in terms of the A-weighted equivalent continuous sound pressure level (L_{eq}). $L_{eq (30minutes)}$ was used as the monitoring parameter for the impact monitoring in the time period between 0700 to 1900 hours on normal weekdays. For all other time period, $L_{eq (5minutes)}$ was employed for comparison with the Noise Control Ordinance (NCO) criteria.

Noise measurement results obtained from each monitoring location were recorded in the Construction Noise Monitoring Data Sheet (Appendix E) immediately after the measurement. As supplementary information for data auditing, statistical results L_{10} and L_{90} were also be recorded for reference.

In case of non-compliance with the construction noise criteria, more frequent monitoring, as specified in the Action plan in Table 4.5.2, shall be carried out. This additional monitoring shall be carried out until the recorded noise levels are rectified or proved to be irrelevant to the construction activities.

4.2 Monitoring Equipment

The sound level meters and calibrators comply with the International Electrotechnical Commission Publications 651:1979 (Type 1) and 804:1985 (Type 1) specifications as referred to in the Technical Memorandum (TM) to the Noise Control Ordinance was deployed as monitoring equipment for noise measurement.

Noise measurement was not be made in the presence of fog, rain, wind with a steady speed exceeding 5ms⁻¹ or wind with gust exceeding 10ms⁻¹. Thus wind speed was checked by the portable wind speed indicator capable of measuring the wind speed in m/s. Table 4.2.1 summarizes the equipment list for noise monitoring

Equipment	Manufacturer & Model No.	Precision Grade	Qty							
Integrated sound level meter	ACO Japan, model 6224	IEC 651 Type 1 IEC 804 Type 1	1							
Windscreen	Microtech gefell model W2	N/A	1							
Acoustical calibrator	Castle GA 607	IEC 942 Type 1	1							
Wind speed indicator	Kestrel K1000	N/A	1							
Remarks: Calibration details for the sound level meter is given in Appendix C for reference										

Table 4.2.1 Equipment List for Noise Monitoring

4.3 Monitoring Locations

According to the Baseline Monitoring Report issued in May 2008 for the captioned project, four locations where are alternative from the locations proposed in EM&A manual, were designated for baseline noise monitoring. For the data validation, impact noise monitoring was undertaken in the same locations during the construction phase of the project. The proposed monitoring locations are summarized in Table 4.3.1. Figure 4.3.1 shows the Noise Monitoring Locations

Noise measurement in each monitoring locations were taken at a point 1m from the exterior of the selected premises and at a height with no disturbance to the dweller and least obstructed view.

Identification No.	Noise Monitoring Locations
N1	No. 73, Village House, Ling Tsui Tau Tsuen (ground level)
N2	No. 31, Village House, Ling Tsui Tau Tsuen (ground level)
N3	Fence wall outside No. 5 village house adjacent to Luk Tei Tong River Outlet (ground level)
N4	No. 23, Village House, Tai Tei Tong River (ground level)

Table 4.3.1 Noise Monitoring Locations during Construction Phase

In accordance with the requirements in the EM&A manual, weekly impact monitoring was conducted. For the time period between 0700 and 1900 hours on normal weekdays, and noise parameter of $L_{eq~(30minutes)}$ was measured. As if the construction works were carried out during restricted period (ie. 1900-2300, 2300-0700 of next day and Sundays / general holiday), impact monitoring that comprises 3 consecutive $L_{eq~(5minutes)}$ would be carried out.

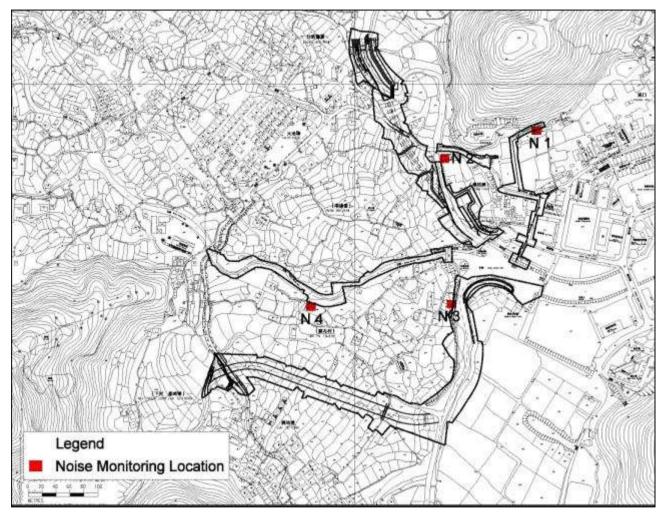

Figure 4.3.1 Impact noise monitoring locations

4.4 Monitoring Results and Interpretation

Relevant details of the noise monitoring results are presented in Table 4.4.1. The results, ranged between 47.4 dB (A) and 66.4 dB (A), were within the limit levels and therefore, no exceedance was found.

Table 4.4.1 Noise Monitoring Results for the reporting month										
Location	Location Parameter		Time	L _{Aeq} dB(A)	Limit dB(A)	Exceedance	Weather

Table 4.4.1 Noise monitoring results

Remarks: Raw datasheet for noise monitoring are attached in Appendix E for reference.

Remark*: The equivalent noise level of N3 is corrected by +3 dB from the raw data result due to the fact that free field measurement was carried out in the location.

4.5 Action and Limit level for Construction noise

The Action and Limit (A/L) levels for construction noise are defined in Table 4.5.1. Should non-compliance of the criteria occur, action in accordance with the Action Plan in Table 4.5.2 should be carried out.

There was no recorded exceedance in the reporting month.

Table 4.5.1 Action and Limit Levels for Construction noise								
Time PeriodAction LevelLimit Le								
0700 – 1900 hours on normal weekdays	75dB(A)							
Remarks: If works are to be carried out during restricted hours, the conditions stipulated in the construction noise permit issued by the Noise Control Authority have to be followed.

	ET	IC(E)	ER	Contractor
Action Level	 Notify IC(E) and Contractor; Carry out investigation; Report the results of investigation to the IC(E), ER and Contractor; Discuss with the Contractor and formulate remedial measures; Increase monitoring frequency to check mitigation effectiveness. 	 Review the analysed results submitted by the ET; Review the proposed remedial measures by the Contractor and advise ER accordingly; Supervise the implementation of remedial measures. 	 Confirm receipt of notification of failure in writing; Notify Contractor; Require Contractor to propose remedial measures for the analysed noise problem; Ensure remedial measures are properly implemented. 	mitigation proposals to IC(E); 2. Implement Noise mitigation proposals.
Limit Level	 Identify source; Inform IC(E), ER, EPD and Contractor; Repeat measurements to confirm findings; Increase monitoring frequency; Carry out analysis of Contractor's working procedures to determine possible mitigation to be implemented; Inform IC(E), ER and EPD the causes and actions taken for the exceedances; Assess effectiveness of Contractor's remedial actions and keep IC(E), EPD and ER informed of the results If exceedance stops, cease additional monitoring 	 Discuss amongst ER, ET, and Contractor on the potential remedial actions; Review Contractors remedial actions whenever necessary to assure their effectiveness and advise the ER accordingly; Supervise the implementation of remedial measures. 	 Confirm receipt of notification of failure in writing; Notify Contractor; Require Contractor to propose remedial measures for the analysed noise problem; Ensure remedial measures properly implemented; If exceedance continues, consider what portion of the work is responsible and instruct the Contractor to stop that portion of work until the exceedance is abated 	 action to avoid further exceedance; Submit proposals for remedial actions to IC(E) within 3 working days of notification; Implement the agreed proposals; Resubmit proposals if problem still not under control; Stop the relevant portion of works as determined by the

Table 4.5.2 Event / Action Plan for Construction Noise

4.6 Noise Mitigation Measures

The following mitigation measures were observed from the weekly site inspection in the reporting month:

- Use of quiet powered mechanical equipment (PME)
- Implementation of the following good site practices:
 - Only well-maintained and regularly serviced plant should be operated on site;
 - Silencers or mufflers on construction equipment;
 - Mobile plant, if any, should be sited as far from noise sensitive receivers as possible; and
 - Machines and plant (such as trucks) that may be in intermittent use should be shut down between work periods or should be throttled down to a minimum.

5. Water Monitoring

5.1 Water Quality Monitoring Parameters and methodology

Turbidity in Nephelometric Turbidity Unit (NTU), Dissolved Oxygen (DO) in mg/L and Suspended Solids (SS) in mg/L are required to measure in this project. Turbidity, DO was measured in-situ while water samples were delivered to Accredited HOKLAS Laboratory for analysis of SS.

Other relevant data such as monitoring location, time, water depth, temperature, salinity, weather conditions and any other special phenomena and work underway at the construction site were recorded during sampling.

According to the requirement of the EM&A manual, two consecutive measurements for parameters of DO concentration, DO saturation and Turbidity are required to be taken at each monitoring location. When the difference in value between the first and second reading of DO or Turbidity is more than 25%, the reading would be discarded and further reading would be taken.

5.2 Monitoring Equipment

Turbidity, DO, Salinity, pH and temperature was measured by an instrument complied with the following requirements:

The instrument is a portable as well as weatherproof multimeter complete with cable and uses a DC power source. It is capable of measuring:

- A turbidity between 0-800NTU;
- A dissolved Oxygen level in the range of 0-20mg/L and 0-200% saturation;
- A temperature of 0-50°C;
- Salinity in the range of 0-40ppt;
- pH in the range of 0-14.

Suspended solid was determined by the water samples collected from the monitoring locations for further analysis in accredited HOKLAS laboratory. Water samples were contained by polythene bottles, packed in ice (cooled in 4°C without frozen) and delivered to the laboratory for analysis as soon as possible after collection. Duplicate samples from each independent sampling event were undertaken during impact monitoring.

Detailed calibration records of the multimeter were shown in Appendix C for reference.

5.3 Monitoring Locations

Seven locations included a control station in upstream of each stream/ river, a monitoring station at the end of each stream/ river of the works area and a monitoring station at Silver River were proposed for the impact water quality monitoring. Water samples were collected at mid-depth of each proposed monitoring stations for measurements and sample collection. The Location Plan is shown in Figure 5.3.1 for reference.

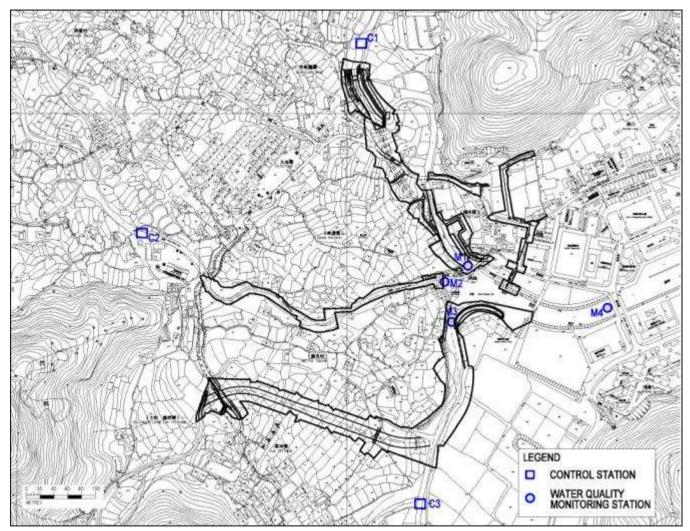

Figure 5.3.1 Water Quality Monitoring Locations

5.4 Monitoring Frequency

Impact water quality monitoring was undertaken three days per week and at ebb tides during the course of the construction river works. Upon the completion of the construction works, the monitoring exercises at the designated monitoring stations will be continued for four weeks in the same manner as the impact monitoring.

5.5 Monitoring Results and Interpretation

Water quality monitoring was carried out seventeen times during August. Detailed on-site measurements and laboratory analysis reports including QA/QC results are shown in Appendix F1 and F2 respectively, while Table 5.5.1 presents consolidated results throughout the reporting month.

Exceedance events on parameters of turbidity, suspended solids and dissolved oxygen were recorded in this reporting period according to the established level. Findings from the investigations showed that the total 89 exceedance events were mainly caused by:

- 1.) Direct discharge of site water without sufficient treatment;
- 2.) Surface run-off from site due to insufficient protective measures (e.g.: bunds and barriers); and
- 3.) Disturbance of sediments and run-off due to adverse rainy weather.

Detailed information of the exceedance events and action taken were presented in Section 7.

		M1			M2			М3			M4		
	MIN	MAX	Ave	MIN	MAX	Ave	MIN	MAX	Ave	MIN	MAX	Ave	
Turbidity (NTU)	1.7	27.8	8.2	0.0	131.4	26.9	2.0	14.9	7.0	2.7	99.6	18.4	
DO (mg/l)	6.3	8.0	7.0	6.0	8.2	6.7	6.0	9.1	6.8	5.9	8.4	6.7

DO (mg/l)	6.2	7.6	6.7	6.3	8.2	6.9	4.7	8.5	6.2
Suspended Solid (mg/l)	1.0	9.1	2.1	1.0	13.2	1.9	2.8	13.6	5.4

* Remarks: Detection limit for Turbidity, DO and SS are 1 NTU, 0.1 mg/L and 1 mg/L respectively.

5.6 Action and limit level for Water Quality

Based on the criteria stipulated in EM&A manual Section 4.8 and baseline water quality monitoring data obtained, the A/L levels are shown in Table 5.6.1 and Table 5.6.2. If the water quality monitoring results at any impact stations exceeded the criteria, the actions in accordance with the Event and Action Plan in Table 5.6.3 should be taken.

Parameters	Action	Limit
DO in mg/L (mid-depth)	- 5%-ile of baseline data	- 4mg/L
SS in mg/L (mid-depth)	 95%-ile of baseline data; or 120% of control station's SS on the same day of measurement 	 99%-ile of baseline; or 130% of control station's SS on the same day of measurement
Turbidity in NTU (mid-depth)	 95%-ile of baseline data; or 120% of control station's turbidity on the same day of measurement 	 99%-ile of baseline; or 130% of control station's turbidity on the same day of measurement

Table 5.6.1 Water quality criteria for monitoring

Table 5.6.2 Action and Limit Levels established according to baselin	e data
--	--------

	Monitoring locations										
Parameters	Μ	[1	M2		Μ	[3	M4				
r ar ameter s	Action Level	Limit Level	Action Level	Limit Level	Action Level	Limit Level	Action Level	Limit Level			
T 1'1'	Level	Level	Level	Level	Level	Level	Level	Level			
Turbidity (NTU)	15.2	16.9	5.3	6.5	16.8	26.0	16.2	18.0			
DO (mg/L)	5.7	4.0	6.2	4.0	5.9	4.0	5.9	4.0			
SS (mg/L)	12.2	12.8	3.1	4.2	12.4	17.7	13.9	15.2			

Remarks:

For DO, non-compliance of the water quality limits occurs when monitoring result is lower than the limits

For SS and turbidity, non-compliance of the water quality limits occurs when monitoring result is higher than the limits.

Table 5.6.3 Event and action Plan for Water Quality

5.7 Water Quality Mitigation Measures

Construction Run-off and Drainage

The site practices outlined in ProPECC PN 1/94 'Construction Site Drainage" should be followed as far as practicable during both construction and operation phase of the drainage improvement works in order to minimize surface runoff and the chance of erosion, and also to retain and reduce any suspended solids prior to discharge.

As recommended in the final EM&A manual, attention would be paid especially construction run-off and drainage, general construction activities, sewage discharged from construction workforce and river channel excavation works.

Contractor was recommended to provide sufficient water treatment facilities for accumulated site water and excavation activities carried out nearby river channel. Earth bunds should be provided to the construction site in / next to the river channel to form an enclosed, dry environment to minimize water quality impact.

5.8 Water Monitoring Schedule for the Next reporting period

Water monitoring in the next reporting period is scheduled for 2, 3, 7, 9, 11, 14, 16, 18, 21, 23, 24, 28, 29 and 30 September.

6. Ecology Monitoring

6.1 Ecological Monitoring Parameters

According to the Final EM&A Manual, a specific ecological monitoring programme of the improved section of PNH and LTT Rivers is recommended. The monitoring parameters required to measure in this project and survey methodology are described below:

(1) Avifauna species and abundance: Birds will be surveyed quantitatively using transect count method. Birds within the river channel and on the riverbank will be identified and their abundance will be recorded.

(2) Aquatic macroinvertebrate community species composition and abundance: Survey on aquatic fauna will focus on determination of the diversity and abundance of stream aquatic communities. Sampling methods, such as active searching, direct observation, netting, and kick sampling, will be determined according to the site conditions during field survey.

(3) Fish community species composition and abundance: Sampling methods, such as active searching, direct observation, and hand netting, will be determined according to the site conditions during field survey.

(4) Adult odonate community species composition and abundance: Adult dragonfly will be surveyed quantitatively using transect count method. Adult dragonflies within the river channel and on the riverbank will be identified and their abundance will be recorded. Species requiring close examination will be netted.

(5) Aquatic, emergent and riparian vegetation community species composition and abundance: The area will be walked through. Plant species composition and their relative abundance will be recorded.

(6) Surveys of White-shouldered Starling Sturnus sinensis will be conducted at the disused watchtowers next to LTT river. Breeding of the White-shouldered Starlings will be determined by checking signs of attempt to breed or sign of breeding which include carrying nesting materials, to-and-fro movement of adults carrying food, presence of recently fledged juveniles, etc. The number of breeding pairs and the site observation will be recorded whenever possible. Water Quality Monitoring along LTT and PNH River as well as LTT bypass channel was carried out. Water quality monitoring will include Turbidity in Nephelometric Turbidity Unit (NTU), Dissolved Oxygen (DO) in mg/L and Suspended Solids (SS) in mg/L are required to measure in this project. Moreover, additional water monitoring parameters will be taken for the purposes of ecological monitoring of water quality in this project. The added information will include: BOD, Ammonia, Nitrate and Phosphate concentrations. Turbidity, DO, pH and water flow will be measured in-situ while water samples will be delivered to Accredited HOKLAS Laboratory accredited laboratory and the analyses followed the standard methods according to APHA Standard Methods for the Examination of Water and Wastewater, 20th Edition, or equivalent for analysis of SS, BOD, Ammonia, Nitrate and Phosphate concentrations.

Other relevant data such as monitoring location, time, water depth, temperature, salinity, weather conditions and any other special phenomena and work underway at the construction site will be recorded during sampling.

According to the requirement of the EM&A manual, two consecutive measurements for parameters of DO concentration, DO saturation and Turbidity are required to be taken at each monitoring. When the difference in value between the first and second reading of DO or Turbidity is more than 25%, the reading will be discarded and further reading will be taken.

6.2 Monitoring Equipment and Methodology

Turbidity, DO, Salinity, pH and Temperature will be measured by a instrument complied with the following requirements:

The instrument is a portable as well as weatherproof multimeter complete with cable and uses a DC power source. It is capable of measuring:

- A turbidity between 0-800NTU;
- A dissolved Oxygen level in the range of 0-20mg/L and 0-200% saturation;
- A temperature of 0-50°C;
- Salinity in the range of 0-40ppt;
- pH in the range of 0-14.

Suspended solid was determined by the water samples collected from the

monitoring locations for further analysis in accredited HOKLAS laboratory. Water samples were contained by polythene bottles, packed in ice (cooled in 4°C without frozen) and delivered to the laboratory for analysis as soon as possible after collection. Duplicate samples from each independent sampling event were undertaken during impact monitoring.

6.3 Monitoring Locations

According to the Final EM&A Manual, the improved section of the river channels will be divided into 50m long sections, and ecological survey will be carried out in each of the 50m sections. A total of nine sections will be divided for the two rivers which include:

- Two sections for existing upstream of PNH river (i.e. the proposed 80m long trapezoidal channel)

- Two sections for existing downstream of PNH river (i.e. the proposed 100m long rectangular channel)

- Five sections for existing Luk Tei Tong River (i.e. the proposed 240m long trapezoidal channel)

The disused watchtowers are located at the confluence of the three rivers and next to LTT river.

The Location Plan for ecological is shown in Figure 6.1 for reference.

The improved sections of the river channels require to carrying out water quality monitoring for the ecological purpose. The sampling points for impact monitoring was undertaken in the same place as the baseline monitoring proposed, where include:

- Three points for existing of PNH river
- Three points for existing of Luk Tei Tong River

The Location Plan for ecological water monitoring is shown in Figure 6.2 for reference.

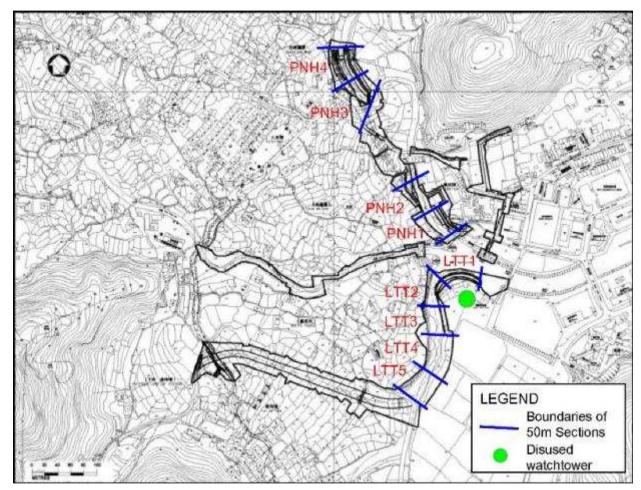

Figure 6.1 Ecological Monitoring Locations

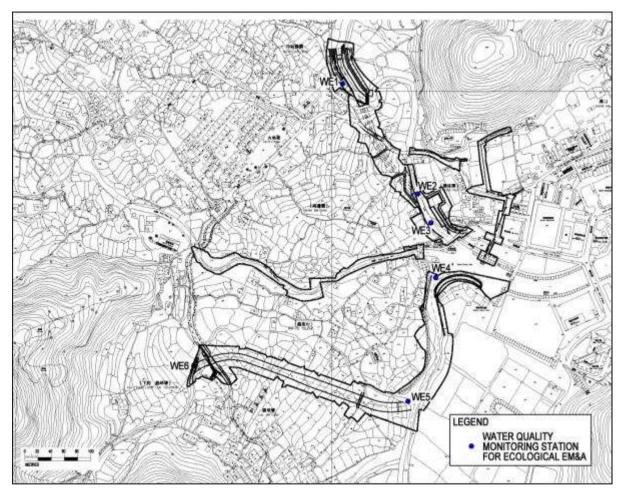

Figure 6.2 Ecological Water Quality monitoring locations

6.4 Monitoring Frequency

As proposed, ecological impact monitoring was carried out once for each monitoring location in the reporting month.

6.5 Monitoring results

Pak Ngan Heung Stream N and S sections

Vegetation

Surveys were conducted on 21 August 2009. The north section of Pak Ngan Heung Stream was fairly modified. Part of the west bank was lined with rock gabion bank and occupied by village houses and abandoned agricultural field. The stream channel was wider than the downstream section, but the stream bank was still fairly narrow and steep in gradient. Compared to the south section, the north section was relatively shaded due to presence of more trees with larger canopy.

The walk through survey recorded a total of 69 species, including 19 trees, 13 shrub, 19 herb and 7 grass species (Appendix D1). 53 of the species recorded are natives, while 16 were exotics. The quantitative sampling recorded 27 species at the north section. Large native (e.g. *Celtis sinensis, Cleistocalyx operculata, Ficus hispida*) and exotic trees (*Acacia confusa*) dominated the transects. Other species recorded include common and typical native pioneer forest and streamside tree species and ruderal species. No species of conservation interest was recorded.

	Relative % cover		
Species	PNH3	PNH4	
Acacia confusa		12.18	
Acorus graminifolia		0.82	
Alocasia macrorrhiza		0.87	
Aporosa dioica		0.70	
Bamboo	14.59		
Celtis sinensis	30.90	19.44	
Christella parasitica	0.34	0.59	
Cleistocalyx operculata	28.84		
Embelia ribes		0.70	
Ficus hispida	0.51	21.90	
Hibiscus rosa-sinensis		0.82	
Litsea glutinosa		12.65	
Macaranga tanarius		8.67	
Mallotus paniculatus	13.73		
Merremia sp.	0.17		
Microstegium ciliatum	0.34	2.81	
Mikania micrantha	1.37	8.43	
Neyraudia reynaudiana		1.83	
Phyllanthus urinaria		0.77	
Pilea microphylla		0.14	
Psychotria asiatica		1.34	
Pueraria phaseoloides		1.36	
Sageretia thea		3.05	
Sporobolus fertilis		0.94	
Syngonium sp.	0.45		
Syzygium jambos	7.38		
Wedelia triloba	1.37		
Total Relative % Cover*	100.0	100.0	
Total Transect Length (m)	13	34	

Table 6.5.1Relative percentage cover of vegetation recorded at PakNgan Heung (N) Section

*Total Cover rounded up to one decimal place to avoid round-off error.

The south section of Pak Ngan Heung Stream was highly modified. Both

banks were lined with rock gabions and were occupied by village houses immediately beyond the channel. The stream channel was lack of riparian zone and vegetation. A total of 11 species recorded, 9 of which were native and 4 were exotic. It was composed of isolated individuals of mangrove (*Acrostichum aureum*), backshore species (*Clerodendrum inerme*) and native (*Celtis sinensis, Ficus microcarpa*) (Appendix D2). No species of conservation interest was recorded. During the monitoring it was observed that site clearance for construction work on the eastern bank at Section PNH1 has started, while the western bank was still intact.

Terrestrial Fauna

Surveys were conducted on 14 August 2009.

A total of two species of birds were recorded in the proposed work area of the Pak Ngan Heung River (Table 6.5.2). Both are common in Hong Kong.

Common names	Latin names	PNH	PNH	PNH	PNH	Commonness
		1	2	3	4	& distribution

Indigo Dropwing	Trithemis festiva			1	1	А	

Table 6.5.3Dragonfly in Pak Ngan Heung River

Crimson Dropwing	Trithemis aurora	1	1	А

A = abundant

Aquatic fauna and fish

10 species of fish and 4 crustacean were recorded in the 4 sections at PNH. All are common and widespread in Hong Kong. Though Predaceous Chub was observed, the another one fish species of conservation concern reported in the EIA report, i.e. Flagtail *Kuhlia marginata*, was not recorded in PNH during the present monthly monitoring survey.

Hillstream Loach	disparis				

+ = Occasional, less than 5 individuals were found; ++ = Common, 5 - 20

individuals were found; +++ = Abundant, more than 20 individuals were found.

Luk Tei Tong Stream Section

Vegetation

Surveys were conducted on 21 August 2009. The Luk Tei Tong Stream Section was highly modified. Vegetation only established on isolated muddy patches at the estuary and remaining semi-natural banks of Section 1 and Section 2. Vegetation on the eastern stream bank from the second half of Section 3 to Section 5 were largely cleared while the western bank was still lined with rock gabions or concrete. The whole section appeared to be subject to tidal influence, as mangrove associated or backshore species were recorded along the whole channel.

The walk through survey recorded a total of 28 species, including 10 tree, 6 shrub, 5 grass species (Appendix D3). 22 of the species recorded are natives, while 6 were exotics. The quantitative sampling recorded 5 species at Sections 2. Section 2 was dominated by *Terminalia catappa* and *Wollastonia biflora*. No quantitative survey was carried out on Section 3 and 4 due to vegetation clearance on stream banks as part of the site clearance works under the project. Vegetation clearance also started on part of Section 2 under the project, resulting in reduced number of species recorded during quantitative sampling.

Due to the patchiness of streamside vegetation, the quantitative data should be interpreted with cautions and used as a reference only.

Table 6.5.5Relative percentage cover of vegetation recorded at Luk Tei Tong
Stream Section

	Relative % cover
Species	LLT2
Acanthus ilicifoius	7.50

Terminalia catappa	51.25
Wollastonia biflora	25.00
Total*	100.0

*Total Cover rounded up to one decimal place to avoid round-off error.

Terrestrial Fauna

The proposed work area of Luk Tei Tong River was divided into 5 sections. All recorded avifauna and dragonfly species are common in Hong Kong

Surveys were conducted on 14 August 2009.

A total of seven species of birds were recorded in these sections (Table 6.5.6). All these species are common and widely distributed in Hong Kong.

LTT LTT LTT LTT **Common names** Latin names LTT Commonness 5 1 2 3 4 & distribution White-throated 1 Halcyon smyrnensis CW Kingfisher Spotted Dove 1 CW *Streptopelia* chinensis Chinese Bulbul 1 Pycnonotus sinensis CW Yellow-bellied Prinia Prinia flaviventris 1 CW Japanese White-eye Zosterops japonica 1 CW Long-tailed Shrike Lanius schach 1 CW

Crimson Dropwing	Trithemis aurora				1		А	

Table 6.5.7Dragonfly in Luk Tei Tong River

A = abundant, C = common

Aquatic invertebrates and fish

6 species of fish, 3 species of crustacean and 3 species of mollusks were recorded in the 5 sections at LTT. All are common and widespread in Hong Kong. The two fish species of conservation concern reported in the EIA report, i.e. Flagtail *Kuhlia marginata* and Predaceous Chub *Parazacco spilurus* were not recorded in LTT during the present monitoring as well as the baseline monitoring survey. As parts of the original stream banks have been being modified for the new gabion walls (such as Section LLT3), the species number and abundance of aquatic fauna in these parts had decreased in previous monitoring. But the diversity and abundance of aquatic fauna might progressively resume as more aquatic fauna were observed in these areas in the present monitoring survey.

Disused Watchtowers

Surveys were conducted on 14 August 2009.

There was no sign (e.g., adults carrying food or nesting materials) of use of the watchtower as nesting habitat by White-shouldered Starling. This species was not observed during the August 2009 monitoring. No bird of other species was observed entering the watchtower.

Most birds in Hong Kong breed between March and July. No sign of nesting of White-shouldered Starling in the disused watchtower was observed during this period.

Since the monitoring surveys commenced in August 2008, no bird was observed entering the watchtower. It seems the birds do not prefer the watchtower as roosting or nesting habitat.

Ecological Water Quality Monitoring (EWQM)

EWQM was conducted on 05 August 2009. Monitoring results are summarized in Table 6.9. Detailed on-site measurements and laboratory report are presented in Appendix D4 and D5.

Table 6.10 shows the baseline results of Ecological Water Quality Monitoring, from the information given in Baseline Monitoring Report.

To review the results in Table 6.9 in general, the measured results were found similar with past months.

Parameters	Limit of detection	WE1	WE2	WE3	WE4	WE5	WE6

	construction activities in	regarding effectiveness of
	previous week	remedial actions.
	5. Discuss remedial	
	actions with Site Engineer	

Table 6.6.1 Event / Action Plan for Monitoring of White-shouldered Starlings

6.7 Ecological monitoring Schedule

The next ecological surveys are scheduled on 11th, and 15th September, while ecological water quality monitoring is scheduled on 3rd September.

7. Action taken in Event of Exceedence

If the measurements (Noise, Water, Ecology) exceed the action / limit level, exceedance details will be reported and follow-up actions will be taken by relevant parties involved.

During the reporting period there was no exceedance for noise, ecological measurements recorded; therefore no actions were taken.

Total 89 non-compliance events of water quality limits (Dissolved Oxygen, Turbidity and Suspended Solids) were recorded in this reporting period according to the established level. ET has arranged site investigations for the exceedance events. Findings from the inspection showed causes were substantially attributable to:

- Direct discharge of site water without sufficient treatment;
- Surface run-off from site due to insufficient protective measures (e.g.: bunds and barriers); and
- Disturbance of sediments and run-off due to adverse rainy weather.

The summary of non-compliance is listed in Table 7.1 for reference.

Among the 89 events of non-compliance recorded in this reporting month, 40 of them were believed to be caused by improper site practice carried out by the contractor. Additional monitoring was carried out in the next day (unless cancelled due to heavy rainstorm) if exceedance of limit level was occurred.

Base on the nature of deficiencies observed, contractor was urged to carry out necessary mitigation measures so as to minimize the disturbance of water quality to minimal level. Site water seepage to the river channel due to overflow and ineffective protection measures were the major cause of exceedance observed. Contractor was advised to rectify bunds and barriers provided to prevent site water directly entering the stream courses. Contractor took the advice and implement corrective actions however, follow up actions provided were found not effective and further improvement was recommended. De-silting tanks were then provided in the late of August. ET will further check the effectiveness of the de-silting tank and contractor was reminded to ensure site water treated fulfilled with the requirements from the applied effluent discharge licenses for discharge.

In accordance with the relevant contractual documents and environmental permits, Contractor was reminded to implement necessary mitigation measures before commencement of construction activities. Contractor was also advised again to be cautious on the conditions of sites as well as mitigation measures provided. Site practices should be reviewed and mitigation measures should be enhanced if water quality was still affected by works. Follow up actions should be taken immediately as to minimize deterioration of water quality as far as practicable.

8. Construction waste disposal

It is the contractor's responsibility to ensure that all wastes produced during the construction phase for the drainage improvement works are handled, stored and disposed of in accordance with good waste management practices and EPD's regulation and requirement. Waste materials generated during construction activities, such as construction and demolition (C&D) material, chemical wastes and general refuse, are recommended to be audited at regular intervals to ensure that proper storage, transportation and disposal practices are being implemented.

Contractor has completed the registration of Waste Producer under the Waste Disposal (Chemical Waste)(General) Regulation. The Waste Producer Number, WPN 5213-950-Y2443-03 was assigned by EPD on 12 Aug 2008. The Contractor would be responsible for the implementation of any mitigation measure to minimize waste or redress problems arising from the waste materials.

Construction waste disposal records provided by Contractor was still outstanding in this reporting month. Table 8.1 is a summary of figures of the construction wastes disposal updated to July 2009.

	Amount of Construction Waste disposed				
Month	Inert Waste Non-inert Waste Chemical Waste				
	(to Public Fill)	(to Landfill)	(to treatment plant)		
1 st to 31 st July	4191.30 (ton)	Nil	Nil		
Total (from June	17589.96 (ton)	65.23 (ton)	0		
08 to July 09)					

9. Status of Permits and Licenses obtained

Table 9.1 is the updated status of environmental related permits/ license obtained for the construction activities

Description	License / Permit No.#	Date of Issue	Date of Expiry	Remarks

11. Site Environmental Audits

11.1 Site Inspection

With an intention to ensure that appropriate environmental protection and pollution control mitigation measures are properly implemented, regular environmental site inspections have been scheduled.

Within the reporting month, site inspections were conducted on 7, 17, 21 and 28 August 2009.

A detailed checklist of each site inspection together with comments, relevant photos and maps have been filed and kept. A summary of observation and follow-up action is shown in Table 11.1

Table 11.1 Summary of site inspection						
Date	Observations	Advice from ET	Action taken	Closing Date		
21 May 09	Vehicle was found washing at the entrance of temporary access at behind of Yuen's compound, where without proper water collection facility.	Contractor was advised to assign a proper wheel washing area with proper water collection facilities, to avoid site runoff entering the mangrove area.	wheel washing facility was provided.	Ongoing		
04, 11, 19 & 26 June 09	U-channel next to the site area BC5 at PNH was not covered. Soil and construction debris was found entered the U-channel.	Contractor was advised to provide proper coverings to protect the U-channel from the contamination of construction materials	U-channel was poorly covered with geo-textile materials and plastic board prior to the inspection on 19 June. Further improvement was required and to be follow up	Ongoing		
02 July & 17 Aug 09	Stagnant water was found in the drip pan of the power generator located at PNH construction site	Contractor was recommended to regularly provide stagnant water removal and mosquito control measures on sites as part of site cleaning practices	Filled with sand as absorbent for oil spillage and stagnant water prevention	28 Aug 09		
02 July 09	Accumulated site water in the box culvert construction site at PNH, was found seeped into the nearby PNH River and hence caused water pollution	Although actions were taken previously to block the seepage from the outlet connected with the site. Contractor was advised to review the condition of the outlet and make sure those was properly sealed	Further enhancement to seal up the outlet was implemented prior to the site inspection on 21 Aug	21 Aug 09		
02, 10, 22, July 09	Site water from the box culvert construction site at PNH was found diverted to a brushwood area nearby	Contractor was recommended again to provide effective de-silting facilities for site water treatment prior to discharging in accordance with the applied water discharge license	The practice was ceased as advised prior to the site inspection on 21 Aug	21 Aug 09		
10, 16, 22, 27 July 09	Damaged water hoses were observed used for diverting site water from retaining wall J	Contractor was advised to replace the damaged hose and re-locate the hoses away from the river channel in case of site water leakage	The water hoses were placed underground inside haul access to prevent site water leakage to the stream course	7 August 09		

	Table	11.1 Summary of site ins	pection	
Date	Observations	Advice from ET	Action taken	Closing Date
16, 22 & 27 July and 7, 28 Aug 09	Open stockpiles of earth materials were observed tipped at PNH BC2 site	Contractor was advised to control size of the stockpiles and provide tarpaulin coverings to prevent erosion	Although tarpaulin coverings were provided stockpiles were not entirely covered. Improvement was required	Ongoing
22 July and 7 Aug 09	Soil run-off and erosion due to excavation activities at Bottleneck B at TTT River was observed	Contractor was advised to provide geo-textile coverings to the bare soil surface of the bunds and haul access. Contractor was also recommended to review and rectify the site condition, bunds as well as barriers provided as to minimize water quality impact due to site works	Geo-textile coverings were provided to the soil surface of bunds and haul access that exposed to the river water.	28 Aug 09
07, 17, 21 & 28 Aug 09	A chemical drum without drip tray was observed at the PNH construction site	Contractor was recommended to provide drip tray for all chemical drums on site. Idling drums should be re-located into designated chemical storage cabinet	Still outstanding until the end of the reporting month. To be follow up	Ongoing
21 Aug 09		implement improvement works to the concerned works area to	Rectification to the defective concrete bunds and its coverings were implemented as advised prior to the site inspection on 28 Aug	28 Aug 09
21 Aug 09	Site water was found discharged to the PNH stream course from a	Although site water was observed to be clear contractor was advised to provide a proper de-silting facilities for site water treatment, and treated site water should be discharged to a designated discharge point in accordance with the applied discharge license.	De-silting tank was provided for site water treatment before discharging to the channel	28 Aug 09
28 Aug 09	(Non-compliance event) Site water from LTT was found diverted to de-silting tank and	contractor was required for	To be followed in the next reporting month	Ongoing

	Table	11.1 Summary of site ins	pection

		concerned site.		

11.2 Compliance with legal and Contractual requirement

ET leader has reviewed the progress and programme of the works to check any relevant environmental laws has not violated.

Non-compliance events regarding site run-off and poor quality of effluent discharge from sites were recorded in this reporting month. As such, Contractor was urged to implement corrective actions include rectification of bunds formed by concrete blocks at retaining wall H, as to prevent further seepage of site water.

Muddy water generated on sites was mostly treated by soak-away in site ground. Site water was not effectively treated and overflowed to the river channel and area outside site boundaries. De-silting tanks were provided at the late of August for site water treatment. However, the effectiveness of the de-silting tanks was concerned and contractor was reminded to provide regular maintenance and cleaning to the tanks. Soak-away by site ground should be prevented as far as practicable to avoid flooding to the nearby area due to silt saturation.

11.3 Environmental Complaint and follow up actions

During this reporting period, there was no documented complaint received. Therefore, follow up actions for the environmental complaint is not required.

Further to the environmental concerns raised by green group during May 2009, Ecologist of ET has conducted a monthly survey to mangrove area at the east of Luk Tei Tong River. Details of findings refer to Appendix K.

Bottleneck at Tai Tei Tong River (located at the downstream of Mui Wo School) was remained half-done that follow up actions were ceased as reported by contractor.

12. Future key issues

Key construction activity in the coming month will include construction of retaining walls at PNH River and TTT River, gabion wall at LTT River, as well as box culvert at PNH River and LTT. It is expected that several impacts on environmental aspects will be generated on-site. With reference to the EM&A manual, mitigation measure report as well as the environmental permit, proper mitigation measures are proposed to be taken, if necessary.

Contractor was seriously advised to provide proper measures to mitigate water quality impacts to the river channels due to construction works. River based construction sites should be well enclosed by bunds in dry condition, as to prevent surface run-off and site water seepage to the stream. Surface of earth bunds should be covered with tarpaulin to prevent soil erosion.

Underground water and site water may be accumulated on site. Contractor is recommended to treat the accumulated site water by proper silt removal facilities before discharging to the designated discharge point; also reuse of site water should be considered. Channel, trench and manholes should be sealed to prevent site water entering public drainage and causing water quality impact.

Contractor was reminded that all vehicles should be washed before leaving sites. Site entrances should be regularly cleaned to prevent soil and construction debris deposited to the public access. Grey water generated from vehicles and/or site washing should be collected and treated before discharge.

Contractor was reminded to be cautious on erosion and surface run-off from the stockpiles of earth materials and exposed earth surfaces. Coverings with

tarpaulin and/or geo-textile materials should be provided to minimize the concerned impacts.

Dust impact may be resulted by boulder movement, breaking and installation works of gabion blocks, contractor is reminded to provide regular watering to the dusty static site area and stockpile. Meanwhile, size and height of stockpiles should be controlled as such erosion issue could be minimized.

13. Conclusions

In this reporting month, construction of retaining walls at PNH River and LTT River, box culvert at PNH and LTT, as well as gabion wall at TTT River were being carried out.

Regular site meetings and inspection audits led by the seniors for discussing site environmental matters were held among Project Proponent, Contractor and the ET on weekly basis. Also monthly site meeting and inspection audits with the above parties and IEC were carried out at the mid of the reporting month.

For noise level monitoring, all results were within the established A/L limits.

For water quality monitoring, total 89 non-compliance events of water quality criteria were recorded in this reporting month. Except natural fluctuation and influence of adverse weather exceedances were mainly caused by site water discharge due to poor site conditions and influence of rainstorm. As such contractor was urged to review their site condition, working method and implementation status of mitigation measures as to prevent further water quality impact. Although follow up actions has been taken as reported by the Contractor, ongoing improvement works were required further to the outcome of the inspections and follow up investigations.

During ecological monitoring survey, no White-shouldered Starling was recorded breeding in the watch tower. There was no sign of disturbance from the Project to the watch tower. The breeding season of White-shouldered Starling in this year has begun. However, the absence of nesting of White-shouldered Starling in the watch tower did not seem to be related to construction works in Luk Tei Tong River. A bird species nests in village house should be to certain extent disturbance tolerant.

No bird was observed entering the watchtower since the monitoring surveys commenced in August 2008. Also, no breeding was recorded in the baseline survey in September 2007. It appears that the birds do not prefer to roost or nest in the watch tower.

Also, there were not any notifications of summons recorded during the reporting period. Furthermore, there were not any formal prosecution and complaints recorded. Non-compliance events regarding site water seepage and direct discharge of site water were recorded in this reporting month. Contractor was urged to rectify the discrepancies as soon as possible to stop further deterioration of water quality.

Site water control was the major concern in this reporting month. Contractor was recommended to provide proper de-silting facilities for site water treatment; conditions of the earth bunds provided should be rectified to prevent surface run-off and soil erosion due to site works. Corrective actions to the identified defects should be implemented as soon as possible to minimize deterioration of water quality.

ET has reminded the contractor to provide environmental pollution control measures wherever necessary; and to keep a good environmental management at site practice.

The ET will continue to implement the environmental monitoring & audit programme in accordance with the EM&A Manual and Environmental Permit requirement.

Test specifications	· ····································		<u></u>			······

- 1, The Sound Level Meter has been calibrated in accordance with the requirements as specified in BS 7580: Part 1: 1997 and the lab calibration procedure SMTP004-CA-152.
- The electrical tests were performed using an electrical signal substituted for the microphone which was removed and replaced by an equivalent capacitance within a tolerance of <u>+20%</u>.
- The acoustic calibration was performed using an B&K 4226 sound calibrator and corrections was applied for the difference between the free-field and pressure responsess of the Sound Level Meter.

02-01-2009

Test results

Approved Signatory:

(

This is to certify that the Sound Level Meter conforms to BS 7580; Part 1: 1997 for the conditions under which the test was performed.

Date:

Details of the performed measurements are presented on page 2 of this certificate.

Actual Measurement data are documented on worksheets.

To

Huang-Jian Mirt/Feng Jun Qi

Còmpany Chop:

Comments: The results reported in this certificate refer to the condition of the instrument on the date of calibration and carry no implication regarding the long-term stability of the instrument.

Form No.CARP152-1/Issue 1/Rev.C/01/02/2007

Hong Kong Accreditation Service (HKAS) has accredited this laboratory under the Hong Kong Laboratory Accreditation Scheme (HOKLAS) for specific laboratory activities as listed in the HOKLAS Directory of Accredited Laboratories. The results shown in this certificate were determined by this laboratory in accordance with its terms of accreditation. Such terms of accreditation stipulate that the results shall be traceable to the International System of Units (S.I.) or recognised measurement standards. This certificate shall not be reproduced except in full.

1, Electrical Tests

The electrical tests were performed using an equivalent capacitance substituted for the microphone. The results are given in below with test status and the estimated uncertainties. The "Pass" means the result of the test is inside the tolerances stated in the test specifications. The "-" means the result of test is outside these tolerances.

Test:	Subtest:	Status:	Uncertanity (dB) / Coverage Factor
Self-generated noise	A	Pass	0.3
_	С	Pass	1.0 2.1
	Lin	Pass	1.5 2.2
Linearity range for Leq	At reference range, Step 5 dB at 4 kHz	Pass	0.3
	Reference SPL on all other ranges	Pass	0.3
	2 dB below upper limit of each range	Pass	0.3
	2 dB above lower limit of each range	Pass	0.3
Linearity range for SPL	At reference range, Step 5 dB at 4 kHz	Pass	0.3
Frequency weightings	Α	Pass	0.3
	С	Pass	0.3
	Lin	Pass	0.3
Time weightings	Single Burst Fast	Pass	0.3
	Single Burst Slow	Pass	0.3
Peak response	Single 100µs rectangular pulse	N/A	N/A
R.M.S. accuracy	Crest factor of 3	Pass	0.3
Time weighting I	Single burst 5 ms at 2000 Hz	Pass	0.3
	Repeated at frequency of 100 Hz	Pass	0.3
Time averaging	1 ms burst duty factor 1/10 ³ at 4kHz	Pass	0.3
	1 ms burst duty factor 1/10 ⁴ at 4kHz	Pass	0.3
Pulse range	Single burst 10 ms at 4 kHz	Pass	0.4
Sound exposure level	Single burst 10 ms at 4 kHz	Pass	0.4
Overload indication	SPL	Pass	0,3
	Leq	Pass	0.4

2, Acoustic tests

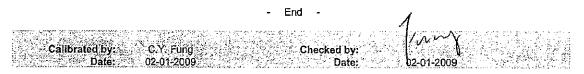

The complete sound level meter was calibrated on the reference range using a B&K 4226 acoustic calibrator with 1000Hz and SPL 94 dB. The sensitivity of the sound level meter was adjusted. The test result at 125 Hz and 8000 Hz are given in below with test status and the estimated uncertainties.

<u>Test:</u>	Subtest	Status	Uncertanity (dB) / Coverage Factor
Acoustic response	Weighting A at 125 Hz	Pass	0.3
	Weighting A at 8000 Hz	Pass	0.5

3, Response to associated sound calibrator

 $\left(\cdot \right)$

The uncertainties have been calculated in accordance with the ISO Publication "Guide to the expression of uncertainty in measurement", and gives an interval estimated to have a level of confidence of 95 %. A coverage factor of 2 is assumed unless explicitly stated.

The standard(s) and equipment used in the calibration are traceable to national or international recognised standards and are calibrated on a schedule to maintain the required accuracy level.

1, Measured Sound Pressure Level

Certificate No.:

The output Sound Pressure Level in the calibrator head was measured at the setting and frequency shown using a calibrated laboratory standard microphone and insert voltage technique. The results are given in below with the estimated uncertainties.

			 Output level in dB re 20 µPa
Frequency	Output Sound Pressure	Measured Output	Estimated
Shown	Level Setting	Sound Pressure Level	Uncertainty
Hz	dB	dB	dB
1000	94.00	94.30	0.1

2, Sound Pressure Level Stability - Short Term Fluctuations

The Short Term Fluctuations was determined by measuring the maximum and minimum of the fast weighted DC output of the B&K 2610 measuring amplifier over a 20 second time interval as required in the standard. The Short Term Fluctuation was found to be:

At 1000 Hz	STF = 0.002 dB
Estimated uncertainty	0.005 dB

3, **Actual Output Frequency**

The determination of actual output frequency was made using a B&K 4180 microphone together with a B&K 2673 preamplifier connected to a B&K 2610 measuring amplifier. The AC output of the B&K 2610 was taken to an universal counter which was used to determine the frequency averaged over 20 second of operation as required by the standard. The actual output frequency at 1 KHz was:

At 1000 Hz	Actual Frequency = 1000.0 Hz	
Estimated uncertainty	0.1 Hz	Coverage factor k = 2.2

4, **Total Noise and Distortion**

For the Total Noise and Distortion measurement, the unfiltered AC output of the B&K 2610 measuring amplifier was connected to an Agilent Type 8903 B distortion analyser. The TND result at 1 KHz was:

At 1000 Hz	TND = 2.1%
Estimated uncertainty	0.7%

The uncertainties have been calculated in accordance with the ISO Publication "Guide to the expression of uncertainty in measurement", and gives an interval estimated to have a level of confidence of 95 %. A coverage factor of 2 is assumed unless explicitly stated.

· -	End -	1
Calibrated by: C.Y. Fung Date: 02-01-2009	Checked by: Date:	MM

The standard(s) and equipment used in the calibration are traceable to national or international recognised standards and are calibrated on a schedule to maintain the required accuracy level.

Noise Monitoring Locations: Total 4 Locations as N1, N2, N3 and N4

Water Quality Monitoring (WQM) Locations: Total 7 Locations as M1, M2, M3, M4, C1, C2 and C3

Ecological Water Quality Monitoring (EWQM) Locations: Total 6 Locations as WE1, WE2, WE3, WE4, WE5 and WE6

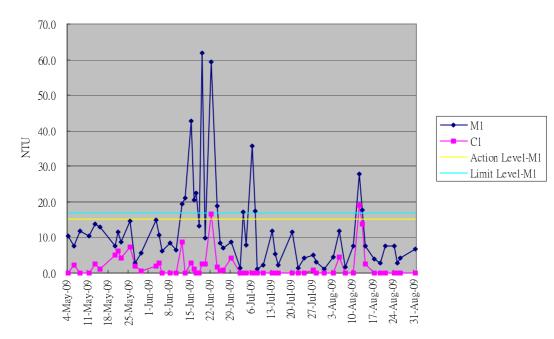

Environmental	Protection / Mitigation Measures	Implementation	Follow-up
Aspect		status	action
Air Quality	Use of regular watering to reduce dust emissions from exposed site surfaces and unpaved road, with complete coverage.	Implemented	
	Use of frequent watering for particular dusty static construction areas and areas close to ASRs.	Implemented	-
	Tarpaulin covering of all dusty vehicle loads transported to and from and between site location;	*	-
	Establishment and use of vehicle wheel and body washing facilities at the exit points of the site.	Implemented	
	Routing of vehicles and positioning of construction plant should be at the maximum possible distance from ASRs.	Implemented	-
Noiso	Use of quiet powered mechanical equipment (PME)	Implemented	-
Noise	Adoption of movable noise barriers and temporary noise barriers	Not applicable at this stage	-
	Application of good site practices mentioned in EM&A manual Clause 3.8.1	Implemented	-
Water Quality	Before commencing any site formation works, all sewer and drainage connections should be sealed to prevent debris, soil, sand etc. from entering public sewers/drains.	Deficiencies found in this reporting month	Ongoing
	Temporary ditches should be provided to facilitate run-off discharge into appropriate watercourses, via a silt retention pond. No site run-off should enter the freshwater marshes at Luk Tei Tong.	Implemented	
	Sand/ silt removal facilities such as sand traps, silt traps and sediment basins should be provided to remove sand/ silt particles from runoff to meet the requirements of the Technical Memorandum standard under the Water Pollution Control Ordinance.		
	Water pumped out from foundation excavations should be discharged into silt removal facilities.	Deficiencies found in this reporting month	Ongoing
	During rainstorms, exposed slope surface should be covered by a tarpaulin or the means.	Deficiencies found in this reporting month	Ongoing
	Exposed soil areas should be minimized to reduce potential for increased siltation and contamination of runoff.	Deficiencies found in this reporting month	Ongoing
	Exposed soil surfaces should be protected by paving or fill material as soon as possible to reduce potential of soil erosion.	Deficiencies found in this reporting month	Ongoing
	Open stockpiles of construction materials or construction wastes on-site of more than 50m ³ should be covered with tarpaulin or similar fabric during rainstorms.	Deficiencies found in this reporting month	Ongoing
	Oils and fuels should only be used and stored on designated areas which have pollution prevention facilities.	Implemented	-
	Temporary sanitary facilities, such as portable chemical toilets, should be employed on-site.	Not applicable	-
	The excavation and widening works for the drainage improvements to the Pak Ngan Heung River, Tai Tei Tong River, Luk Tei Tong River and Luk Tei Tong By-pass Channel should be carried out in sections (approximately 300 –400	Implemented	-
	m in length) and in dry condition.		

Appendix H Implementation Status of environmental protection / mitigation measures

Environmental	Protection / Mitigation Measures	Implementation	Follow-up
Aspect		status	action
	Maintenance desilitng of the re-profiled river channels of the Pak Ngan Heung River, Tai Tei Tong River, Luk Tei tong River and Luk Tei Tong By-pass Channel, temporary barrier walls should be used to provide a dry zone for desilitng work.	Not applicable at this stage	-
Ecology	Existing natural habitats should be retained as far as practicable	Implemented	-
	Boundary of working areas should be identified to prevent loss of vegetation	Implemented	
	All existing trees / plant should be well protected within the site or transplanted properly	Implemented	-
	Turf removal from the Luk Tei Tong marsh due to the construction of Luk Tei Tong Bypass Channel shall be minimized	Implemented	
	Turf from the Luk Tei Tong marsh shall be properly removed, stored, maintained and reused for lining the riverbed of the Luk Tei Tong Bypass Channel	Implemented	
Chemical and	Chemical wastes should be properly stored in a proper store as per statutory requirements (i.e. on a hard standing, within an enclosed and locked area)	Implemented	-
Solid Waste	Chemical waste stores should be provided with fire precaution facilities (i.e. fire extinguisher, no smoking warning etc).	Implemented	-
	Chemical wastes should be properly stored in corrosion resistant containers placed inside the store and labelled with warning signs in English and Chinese.	Implemented	-
	Chemical wastes should be disposed of by licensed chemical waste collector with supporting delivery records.	Implemented	-
	All containers for fuel, diesel and fluid chemical (in use) and oil filled stationery plants located with proper drip pans.	this reporting month	Ongoing
	Construction wastes should be managed and disposed to the designated public fill and landfill areas in acceptable manner.	Implemented	-
	All waste disposals managed in a proper manner i.e. trip ticket system implementation.	Implemented	-

Graphical plot of noise monitoring results

Appendix K Ecological Survey Report for the mangrove area at Luk Tei Tong

Ecological Survey Report for the mangrove area at Luk Tei Tong

Background

In response to the concerns from green groups on the mangrove area to the east of Luk Tei Tong River, contractor took action to install pipes between Luk Tei Tong River and the mangrove area on 25 May 2009 as agreed on a meeting in mid May.

The inlet pipes from Luk Tei Tong River to the mangrove area consist of two sections. The first section is between the mangrove area wetland and the excavation area. The second section is between the excavation area and Luk Tei Tong River.

The inlet pipes would be constructed at a level of 1.7mPD so as to allow water to flow naturally from Luk Tei Tong River during high tide into the wetland.

Meanwhile river water would be pumped into the mangrove areas from the river at high tide. The tidal effects on the mangroves shall be maintained at all times throughout the remaining part of the river works.

A monitoring for the mangrove area was conducted, weekly for one month starting form 27 May 2009 after installation of the twin pipes. Thereafter, the monitoring will be monthly till the completion of gabion wall construction and the original water inlet is reinstated (tentatively by the end of August 2009).

The objectives of the ecological monitoring are to:

- to document the completion installation and proper operation of the temporary twin 400mm pipes
- to document the general health condition of the mangrove community at Luk Tei Tong
- to evaluate reinstatement of the natural tidal flow

Method

Field survey was conducted on 21 August 2009.

The survey was conducted during low tide period (around 3pm). Photos of the construction site, including the twin inlet pipes and the mangrove communities were taken for documentation. The condition of the pipe was checked, and the health

condition of the mangroves were observed and recorded.

Results

The installed inlet pipes were general in fair condition. However, it was noted that the end of both inlet pipes at Luk Tei Tong River was covered with plastic sheet (**Photo 1**). The Contractor was reminded to maintain the opening of the pipes clear, to make sure unrestricted tidal flow. During the survey the water level was below the pipe openings, and therefore no water flow between the mangroves and was observed.

The mangrove communities were more exposed during the current survey. Most of the dominant mangrove or mangrove associated species, including *Phragmites australis*(**Photos 2**), *Aegiceras corniculatum* (**Photos 3**) and *Acrostichum aureum* (**Photo 4**) were in fair conditions, while the latter two species had somewhat more yellowing and dry leaves, but no signs of mortality were observed. Mortality of a dominant mangrove associate, *Acanthus ilicifolius*, was stabilised (**Photo 5**). Mangrove fauna including mangrove crabs (**Photo 6**) and fishes were observed, and they appeared active during the survey period.

Conclusions and Recommendations

The plastic sheet on the Long Tei River side should be removed from the pipe endings to allow free tidal exchange.

It is anticipated that the gabion installation of this section of Luk Tei Tong River will be completed soon. It is recommended that the new box culvert should be reinstated to its original level. With all temporary bunds removed and the stream bed reinstated to its original condition, it is expected that original tidal exchange pattern could be restored.

The majority of the mangrove plants inside the concerned area were still in good conditions, but mortality of a dominant mangrove associate, *Acanthus ilicifolius*, was stabilised. With the reinstatement of the box culvert, it is expected that these mangrove associate plants would recover gradually after.

The next monthly mangrove monitoring would be conducted in September 2009.
