#### **EXECUTIVE SUMMARY**

The construction works of *No. EP/SP/61/10 Organic Resources Recovery Centre Phase 1 (the Project)* commenced on 21 May 2015. This is the 54<sup>th</sup> monthly Environmental Monitoring and Audit (EM&A) report presenting the EM&A works carried out during the period from 1 to 30 November 2019 in accordance with the EM&A Manual. Substantial completion of the construction works was confirmed on 3 December 2018. In the meantime, the operation phase EM&A programme had commenced in March 2019.

## Summary of Works undertaken during the Reporting Month

Works undertaken in the reporting month included:

- Operation of the Project, including organic waste reception, and operation of the pre-treatment facilities, anaerobic digesters, composting facilities, air pollution control systems, on-line emission monitoring system for the Centralised Air Pollution Control Unit (CAPCS), Co-generation Units (CHP)s and Ammonia Stripping Plant (ASP), and the wastewater treatment plant;
- Process fine-tune, including adjustment of the ASP with new treatment media, modification of Continuous Environmental Monitoring System (CEMS) and Supervisory Control and Data Acquisition System (SCADA) rectification and improvement works following equipment failures and the alteration of different operation modes and measures to adapt to the high variation of SSOW nature and sources; and
- Visitor Centre BS works (MVAC, FS, and cladding).

# **Environmental Monitoring and Audit Progress**

# Air Quality Monitoring

Exceedances on NO<sub>x</sub> and SO<sub>2</sub> from CHP and NO<sub>x</sub> and NH<sub>3</sub> from ASP were recorded on the on-line monitoring system. It should be noted that measurements recorded under abnormal operating conditions, e.g. start up and stopping of stacks, unstable operation, test runs and interference of sensor, are disregarded.

Exceedances in emission parameters of CHP and ASP were found to be a result of problems with the continuous fine-tuning of CHP setting, incomplete desulphurisation of biogas which fed to the CHPs, and tripping and stopping of ASP and the incomplete thermal combustion of the thermal combustion unit of the ASP.

The Contractor has implemented mitigation measures to control the exceedance (including the re-adjustment for NO<sub>x</sub> control for CHP; continuous monitoring and routine maintenance of the desulphurisation column is carried out; and tuning the thermal combustion unit of the ASP to optimise combustion efficiency and overall performance).

The Contractor is recommended to closely monitor the processes of the modification of the ASP and the post-modification monitoring of emission level to avoid any exceedance.

#### Water Quality

No non-compliance to the effluent discharge limit stipulated in the discharge licence issued by the EPD under the *Water Pollution Control Ordinance* was recorded during this reporting period.

#### Waste Management

Waste generated from the construction of the Project includes inert construction and demolition (C&D) materials (public fill) and non-inert C&D materials (construction wastes).

Inert C&D materials (public fill) include bricks, concrete, building debris, rubble and excavated spoil. In total, 0.00 tonnes of inert C&D material were generated from the construction of the Project.

Non-inert C&D materials (construction wastes) from the construction of this Project include metals, paper/ cardboard packaging waste, plastics and other wastes such as general refuse. 0.00 kg of metals, 0.00 kg of papers/ cardboard packing and 0.00 kg of plastics were sent to recyclers for recycling during the reporting period. 0.00 tonnes of general refuse was disposed of at the landfill.

0.00 L of chemical waste was collected by licenced waste collector from the construction of the Project.

Waste generated from the operation of the Project includes chemical waste, waste generated from pre-treatment process and general refuse.

1,600 L of chemical waste was collected by licenced waste collector from the operation of the Project.

451.57 tonnes of waste generated from pre-treatment process from the operation of the Project was disposed of at landfill. Among the recyclable waste generated from pre-treatment process from the operation of the Project, 0.00 kg of metals, 0.00 kg of papers/ cardboard packing and 0.00 kg of plastics were sent to recyclers for recycling during the reporting period.

Around 3.00 tonnes of general refuse from the operation of the Project was disposed of at landfill. Among the recycled general refuse from the operation of the Project, 0.00 kg of metals, 0.00 kg of papers/ cardboard packing and 0.00 kg of plastics were sent to recyclers for recycling during the reporting period.

#### **Findings of Environmental Site Audit**

A summary of the monitoring activities undertaken in this reporting period is listed below:

- Joint Environmental Site Inspections
   4 times
- Landscape & Visual Inspections

2 times

4 weekly joint environmental site inspections were carried out by the representatives of the Contractor and the ET. The ER and IEC were also present at the joint inspections on 27 November 2019. The environmental control/ mitigation measures (related to air quality, water quality, waste (including land contamination prevention), hazard-to-life and landscape and visual) recommended in the approved EIA Report and the EM&A Manual were properly implemented by the Contractor during the reporting month.

# Environmental Exceedance/Non-conformance/Compliant/Summons and Prosecution

Exceedances for the air emission limits for the CHP and ASP stacks were recorded during the reporting period.

An incident related to the leakage of suspension liquid from the intermediate digestate tank occurred on 5 November 2019 and an incident related to the leakage of treated effluent from the pump room occurred on 23 November 2019.

An incident related to the release of biogas occurred on 25 August 2019. The incident has been resolved. The investigation will be reported in the next reporting period.

No complaint/ summon/prosecution was received in this reporting period.

# Future Key Issues

Activities to be undertaken in the next reporting month include:

- Operation of the Project.
- Modification of the ASP to control the air emission.
- Visitor Centre BS works (exhibition fixture installation).

#### 1 INTRODUCTION

ERM-Hong Kong, Limited (ERM) was appointed by OSCAR Bioenergy Joint Venture (the Contractor) as the Environmental Team (ET) to undertake the construction Environmental Monitoring and Audit (EM&A) programme for the *Contract No. EP/SP/61/10 of Organic Waste Treatment Facilities Phase I,* which the project name has been updated to *Organic Resources Recovery Centre (Phase I) (the Project)* since November 2017. ERM was also appointed by the Contractor to undertake the operation EM&A programme starting 1 March 2019.

#### 1.1 PURPOSE OF THE REPORT

This is the 54<sup>rth</sup> EM&A report which summarises the monitoring results and audit findings for the EM&A programme during the reporting period from **1** to **30 November 2019**.

#### **1.2** STRUCTURE OF THE REPORT

The structure of the report is as follows:

#### Section 1: Introduction

It details the scope and structure of the report.

#### Section 2: Project Information

It summarises the background and scope of the Project, site description, project organisation and status of the Environmental Permits (EP)/licences.

# Section 3: Environmental Monitoring and Audit Requirements It summarises the environmental monitoring requirements including monitoring parameters, programmes, methodologies, frequency, locations, Action and Limit Levels, Event/Action Plans, as well as environmental audit requirements as recommended in the EM&A Manual and approved EIA report.

*Section 4: Monitoring Results* It summarises monitoring results of the reporting period.

# *Section 5: Site Audit* It summarises the audit findings of the environmental as well as landscape and visual site audits undertaken within the reporting period.

Section 6: Environmental Non-conformance It summarises any exceedance of environmental performance standard, environmental complaints and summons received within the reporting period.

# *Section 7: Further Key Issues* It summarises the impact forecast for the next reporting month.

Section 8: Conclusions

#### 2 PROJECT INFORMATION

#### 2.1 BACKGROUND

The Organic Resources Recovery Centre (ORRC) Phase I development (hereinafter referred to as "the Project") is to design, construct and operate a biological treatment facility with a capacity of about 200 tonnes per day and convert source-separated organic waste from commercial and industrial sectors (mostly food waste) into compost and biogas through proven biological treatment technologies. The location of the Project site is shown in *Annex A*.

The environmental acceptability of the construction and operation of the Project had been confirmed by findings of the associated Environmental Impact Assessment (EIA) Study completed in 2009. The Director of Environmental Protection (DEP) approved this EIA Report under the *Environmental Impact Assessment Ordinance* (EIAO) (Cap. 499) in February 2010 (Register No.: AEIAR-149/2010) (hereafter referred to as the approved EIA Report). Subsequent Report on Re-assessment on Environmental Implications and Report on Re-assessment on Hazard to Life Implications were completed in 2013, respectively.

An Environmental Permit (EP) (No. EP-395/2010) was issued by the DEP to the EPD (Project Team), the Permit Holder, on 21 June 2010 and varied on 18 March 2013 (No. EP-395/2010/A) and 21 May 2013 (No. EP-395/2010/B), respectively. The Design Build and Operate Contract for the ORRC Phase 1 (Contract No. EP/SP/61/10 Organic Resources Recovery Centre (Phase 1) (the Contract)) was awarded to SITA Waste Services Limited, ATAL Engineering Limited and Ros-Roca, Sociedad Anonima jointly trading as the OSCAR Bioenergy Joint Venture (OSCAR or the Contractor). A Further EP (No. FEP-01/395/2010/B) was issued by the DEP to the OSCAR on 16 February 2015. Variation to both EPs (Nos. EP-395/2010/B and FEP-01/395/2010/B) were made in December 2015. The latest EPs, Nos. EP-395/2010/C and FEP-01/395/2010/C, were issued by the DEP on 21 December 2015.

Under the requirements of Condition 5 of the EP (No. FEP-01/395/2010/C), an Environmental Monitoring and Audit (EM&A) programme as set out in the approved EM&A Manual (hereinafter referred to as EM&A Manual) is required to be implemented during the construction and operation of the Project. ERM-Hong Kong, Ltd (ERM) has been appointed by OSCAR as the Environmental Team (ET) for the construction phase EM&A programme and the Monitoring Team (MT) for the operation phase EM&A programme for the implementation of the EM&A programme in accordance with the requirements of the EP and the approved EM&A Manual.

The construction works commenced on 21 May 2015. The operation phase of

the EM&A programme commenced on 1 March 2019<sup>(1)</sup>.

#### 2.2 GENERAL SITE DESCRIPTION

The Project Site is located at Siu Ho Wan in North Lantau with an area of about 2 hectares. The layout of the Project Site is illustrated in *Annex A*. The facility received and treated an average of 100 tonnes of source separated organic waste per day during the reporting month.

#### 2.3 MAJOR ACTIVITIES UNDERTAKEN

A summary of the major activities undertaken in the reporting period is shown in *Table 2.1*. The site layout plan is shown in *Annex B*. The construction programme is shown in *Annex C*.

#### Table 2.1Summary of Activities Undertaken in the Reporting Period

#### Activities Undertaken in the Reporting Period

- Systems being operated waste reception, pre-treatment, CAPCS extraction, the digesters, the centrifuge, , the composting tunnels the desulphurisation, the emergency flare, the CHPs, the ASP and the biological waste water treatment plant (about 100-130 t/d SSOW input);
- Process fine-tune adjustment of the ASP operational parameters with new treatment media, CEMS/SCADA modification and improvement work following equipment failures and the alteration of different operation modes and measures to adapt to the high variation of SSOW nature and sources; and
- Visitor Centre BS works (MVAC, FS, and cladding).

#### 2.4 PROJECT ORGANISATION AND MANAGEMENT STRUCTURE

The project organisation chart and contact details are shown in *Annex D*.

#### 2.5 STATUS OF ENVIRONMENTAL APPROVAL DOCUMENTS

A summary of the valid permits, licences, and/or notifications on environmental protection for this Project is presented in *Table 2.2*.

#### Table 2.2 Summary of Environmental Licensing, Notification and Permit Status

#### 3 ENVIRONMENTAL MONITORING AND AUDIT REQUIREMENTS

#### 3.1 ENVIRONMENTAL MONITORING

The air quality (including odour) monitoring to be carried out during the commissioning and operation phase of the Project are described below. No monitoring for noise, waste, land contamination, hazard-to-life and landscape and visual are required during construction and operation phases of the Project. Although water quality monitoring is not required for the construction and operation phases under the EM&A programme, there are water quality monitoring requirement under the Water Discharge Licence of the plant under the *Water Pollution Control Ordinance* (WPCO). As part of this EM&A programme, the monitoring results will be reviewed to check the compliance with the WPCO requirements.

#### 3.1.1 Air Quality

According to the EM&A Manual and EP requirements, stack monitoring are required during the commissioning and operation phase of the Project.

On-line monitoring (using continuous environmental monitoring system (CEMS) shall be carried out for the centralised air pollution unit (CAPCS), cogeneration units (CHP) and the ammonia stripping plant (ASP) during the commissioning and operation phase. The calibration certificate for the on-line monitoring equipment is provided in *Annex E*.

The monitoring data is transmitted instantaneously to EPD (Regional Office) by telemetry system.

When the on-line monitoring for certain parameter cannot be undertaken, monitoring will be carried out using the following methodology approved by the EPD.

Parameters	Method	Stacks to be Monitored
Gaseous and vaporous organic	USEPA Method 18	• CAPCS
substances (including methane)		• CHP
		• ASP
Particulate	USEPA Method 5	• CAPCS
		• CHP
		• ASP
Carbon monoxide (CO)	USEPA Method 10	• CHP
		• ASP
Nitrogen oxides (NO <sub>x</sub> )	USEPA Method 7E	• CHP
		• ASP
Sulphur dioxide (SO <sub>2</sub> );	USEPA Method 6	• CHP
		• ASP

#### Table 3.1Sampling and Laboratory Analysis Methodology

Parameters	Method	Stacks to be Monitored
Hydrogen chloride (HCl)	USEPA Method 26A	• CHP
		• ASP
Hydrogen fluoride (HF)	USEPA Method 26A	• CHP
		• ASP
Oxygen (O <sub>2</sub> );	USEPA Method 3A	• CAPCS
		• CHP
		• ASP
Velocity and Volumetric Flow	USEPA Method 2	• CAPCS
		• CHP
		• ASP
Ammonia (NH <sub>3</sub> )	USEPA CTM 027	• ASP
Odour (including NH <sub>3</sub> and H <sub>2</sub> S)	EN 13725	• CAPCS
Water vapour content (continuous	USEPA Method 4	• CAPCS
measurement of the water vapour		• CHP
content should not be required if the sample exhaust gas is dried before the		• ASP
emissions are analysed)		
Temperature	USEPA Method 4	• CAPCS
		• CHP
		• ASP

With reference to the EM&A Manual, the air emission of the stacks shall meet the following emission limits as presented in *Tables 3.2* to *3.5*.

# Table 3.2Emission Limit for CAPCS Stack

Parameter	Emission Level (mg/Nm <sup>3</sup> ) <sup>(a)</sup>
VOCs (including methane)	680
Dust (or Total Suspended Particulates (TSP))	6
Odour (including NH3 & H2S)	220 (b)
Notes:

Notes:

(a) All values refer to an oxygen content in the exhaust gas of 11% and dry basis.

(b) Hourly average concentration

(c) The VOCs emission limit include methane as biogas is adopted as fuel in the combustion process.

#### 3.1.2 *Odour*

To determine the effectiveness of the proposed odour mitigation measures and to ensure that the operation of the ORRC1 will not cause adverse odour impacts, odour monitoring of the CAPCS stack (see *Section 3.1.1*) and odour

A standby facility. Only operate when the CHPs are not in operation or when the biogas generated exceeded the utilisation rate of the CHPs.

patrol will be carried out.

Odour patrol shall be conducted by independent trained personnel/ competent persons in summer months (i.e. from July to September) for the first two operational years of ORRC1 at monthly intervals along an odour patrol route at the Project Site boundary as shown in *Annex*  $A^{(1)}$ .

The perceived odour intensity is divided into 5 levels. *Table 3.6* describes the odour intensity for different levels.

#### Table 3.6Odour Intensity Level

Level	Odour Intensity
0	Not detected. No odour perceived or an odour so weak that it cannot be easily characterised or described
1	Slight identifiable odour, and slight chance to have odour nuisance
2	Moderate identifiable odour, and moderate chance to have odour nuisance
3	Strong identifiable, likely to have odour nuisance
4	Extreme severe odour, and unacceptable odour level

*Table 3.7* shows the action level and limit level to be used for odour patrol. Should any exceedance of the action and limit levels occurs, actions in accordance with the event and action plan in *Table 3.8* should be carried out.

Table 3.7Action and Limit Levels for Odour Nuisance

emission from the ORRC1 and its on-site wastewater treatment unit.

Table 3.8Event and Action Plan for Odour Monitoring

The odour patrol route was changed during this reporting period to include sampling points that are frequently visited by visitors and eliminate sampling points that are not visited by visitors.

Event	Action				
	Person-in-charge of Odour Monitoring	Project Proponent <sup>(a)</sup>			
Action Level					
Exceedance of action level (Odour Patrol)	<ol> <li>Identify source/reason of exceedance;</li> <li>Repeat odour patrol to reaction for large</li> </ol>	<ol> <li>Carry out investigation to identify the source/reason of exceedance.</li> <li>Investigation should be completed within 2 weeks;</li> </ol>			
	confirm finding.	<ol> <li>Rectify any unacceptable practice;</li> </ol>			
		3. Implement more mitigation measures if necessary;			
		4. Inform Drainage Services Department (DSD) or the operator of the Siu Ho Wan Sewage Treatment Works (SHWSTW) if exceedance is considered to be caused by the operation of the SHWSTW.			
		5. Inform North Lantau Refuse Transfer Station (NLTS) operator if exceedance is considered to be caused by the operation of NLTS.			
Exceedance of action level (Odour Complaints)	<ol> <li>Identify source/reason of exceedance;</li> <li>Carry out odour patrol to determinate odour intensity.</li> </ol>	<ol> <li>Carry out investigation and verify the complaint whether it is related to potential odour emission from the nearby SHWSTW;</li> </ol>

	<ul><li>remedial action and keep EPD informed of the results;</li><li>6. If exceedance stops, cease</li></ul>	5. If exceedance continues, consider what more/enhanced mitigation measures should be implemented;			
	additional odour patrol.	6. Inform DSD or the operator of the SHWSTW if exceedance is considered to be caused by the operation of the SHWSTW.			

# Note:

(a) Project Proponent shall identify an implementation agent.

## 3.2 SITE AUDIT

Environmental mitigation measures (related to air quality, water quality, waste, land contamination, hazard-to-life, and landscape and visual) to be implemented during the construction and operation phase of the Project are recommended in the approved EIA Report and EM&A Manual and are summarised in *Annex F*. Weekly site audits for construction phase and monthly site audits for operation phase will be carried out to check the implementation of these measures.

# 3.2.1 Water Quality

Compliance audits are to be undertaken to ensure that a valid discharge licence has been issued by EPD prior to the discharge of effluent from the operation of the Project site. The audit shall be conducted to ensure that the effluent quality is in compliance with the discharge licence requirements. The effluent quality shall meet the discharge limits as described in *Table 3.9*.

Parameters	Discharge Limit (mg/L)
Flow Rate (m <sup>3</sup> /day)	685
pH (pH units)	6-10 (a)
Suspended Solids	800
Biochemical Oxygen Demand (5 days, 20°)	800
Chemical Oxygen Demand	2,000
Oil & Grease	40
Total Nitrogen	200
Total Phosphorus	50
Surfactants (total)	25
Note:	
(a) Range.	

# Table 3.9Discharge Limits for Effluent

# 3.2.2 Landscape and Visual

In accordance with EM&A Manual, the landscape and visual mitigation measures shall be implemented. Bi-weekly landscape and visual audit during the construction phase is required to ensure that the design, implementation and maintenance of landscape and visual mitigation measures recommended in the approved EIA Report are fully achieved. The implementation status of the mitigation measures for construction phase is summarised in *Annex F*.

For operation phase, site inspection shall be conducted once a month for the first year of operation of the Project. All measures as stated in the implementation schedule of the EM&A Manual (see *Annex F*), including compensatory planting, undertaken by both the Contractor and the specialist Landscape Sub-Contractor during the first year of the operation phase shall be audited by a Registered Landscape Architect (RLA) to ensure compliance with

the intended aims of the measures and the effectiveness of the mitigation measures.

## 4 MONITORING RESULTS

#### 4.1 AIR QUALITY

## 4.1.1 Commissioning Phase Monitoring

Monitoring results of air quality parameters from stack emissions of the centralised air pollution control system, the ammonia stripping plant and the cogeneration units will be provided once available to show compliance with the monitoring requirements stated in the EM&A Manual (Rev. F) to support the termination of the construction phase EM&A programme.

#### 4.1.2 *Operation Phase Monitoring*

The concentrations of concerned air pollutants emitted from the stacks of the CAPCS, CHP, and ASP during the reporting period are monitored on-line by the continuous environmental monitoring system (CEMS). During the reporting period, there is no need to operate the standby flare and therefore no monitoring of the flare stack was undertaken.

With reference to the emission limits shown in *Tables 3.2, 3.3* and *3.4*, the hourly average concentrations and the number of exceedances of the concerned air emissions monitored for the CAPCS, CHP and ASP during this reporting period are presented in *Tables 4.1* to *4.5*.

It should be noted that measurements recorded under abnormal operating conditions, e.g. start up and stopping of stacks, unstable operation, test runs and interference of sensor, are disregarded.

Table 4.1	Hourly Average of Parameters Recorded for CAPCS	
-----------	---	--

Parameter	Range of Hourly Average Conc. (mg/Nm³)	Emission Limit (mg/Nm³)	Exceedance Identified	Remarks
VOCs (including methane) <sup>(a)</sup>	24 - 643	680	Nil	Nil
Dust (or TSP)	0.0 - 0.0	6	Nil	Nil
Odour (including $NH_3 \& H_2S$ ) <sup>(b)</sup>	0 - 30	220	Nil	Nil
Notes:				

(a) Online monitoring was not available during this reporting period. Alternative monitoring method as specified in the EM&A manual was used to measure VOCs. The Contractor has arranged for replacement of the sensor immediately. The sensor is expected to be installed in the next reporting period.
(b) The end of the formation of the sensor is expected to be installed in the next reporting period.

(b) The odour unit is  $OU/Nm^3$ .

#### Table 4.2Hourly Average of Parameters Recorded for CHP 1

Parameter	Range of Hourly Average Conc. (mg/Nm <sup>3</sup> ) <sup>(a)</sup>	Max. Emission Limit (mg/Nm³)	Exceedance Identified	Remarks
Dust (or TSP)	0 - 14	15	Nil	Nil
Carbon Monoxide	0 - 333	650	Nil	Nil
NO <sub>x</sub>	0 - 287	300	Nil	Nil
SO <sub>2</sub>	0 - 121	50	Identified (d)	Tripping of the desulphurisation system.
NMVOCs (b)	Nil	150	Nil	Nil
VOCs (including methane) <sup>(c)</sup>	0 - 1,134	1,500	Nil	Nil
HC1	0	10	Nil	Nil
HF	0.0 - 0.5	1	Nil	Nil

#### Notes:

(a) All values refer to an oxygen content in the exhaust gas of 6% and dry basis.

(b) No sampling was undertaken at CHP1 as biogas production rate could not sustain the operation of the CHP stack for the scheduled samplings.

(c) The VOCs emission limit include methane as biogas is adopted as fuel in the combustion process.

(d) Dates with exceedances on SO<sub>2</sub> (number of exceedances on the day) were identified on 9
 (2), 10 (3), 11 (4) and 12 (7) November 2019.

## Table 4.3Hourly Average of Parameters Recorded for CHP 2

Parameter	Range of Hourly Average Conc. (mg/Nm <sup>3</sup> ) <sup>(a)</sup>	Max. Emission Limit (mg/Nm³)	Exceedance Identified	Remarks
Dust (or TSP)	0 – 8	15	Nil	Nil
Carbon Monoxide	0 - 46	650	Nil	Nil
NO <sub>x</sub>	0 - 294	300	Nil	Nil
SO <sub>2</sub>	0 - 38	50	Nil	Nil
NMVOCs (b)	Nil	150	Nil	Nil
VOCs (including methane) <sup>(c)</sup>	0 - 1,200	1,500	Nil	Nil
HCl	0	10	Nil	Nil
HF	0 - 0.5	1	Nil	Nil

Notes:

(a) All values refer to an oxygen content in the exhaust gas of 6% and dry basis.

(b) Quarterly sampling of NMVOCs in CHP2 was conducted on 19 November 2019, the final result will be provided once available.

(c) The VOCs emission limit include methane as biogas is adopted as fuel in the combustion process.

## Table 4.4Hourly Average of Parameters Recorded for CHP 3

Parameter	Range of Hourly Average Conc. (mg/Nm <sup>3</sup> ) <sup>(a)</sup>	Max. Emission Limit (mg/Nm³)	Exceedances Identified	Remarks
Dust (or TSP)	0	15	Nil	Nil
Carbon Monoxide	0 - 226	650	Nil	Nil
NO <sub>x</sub>	0 – 528	300	Identified (d)	Supplier had been arranged to check the performance of the CHP and maintenance will be arranged after detailed investigation.
SO <sub>2</sub>	0 - 70	50	Identified (e)	Tripping of the desulphurisation system.
NMVOCs (b)	Nil	150	Nil	Nil
VOCs (including methane) <sup>(c)</sup>	0 - 1,192	1,500	Nil	Nil
HCl	1	10	Nil	Nil
HF	0 - 1.0	1	Nil	Nil

Notes:

(a) All values refer to an oxygen content in the exhaust gas of 6% and dry basis.

(b) No sampling was undertaken at CHP3 as biogas production rate could not sustain the operation of the CHP stack for the scheduled samplings.

(c) The VOCs emission limit include methane as biogas is adopted as fuel in the combustion process.

(d) Dates with exceedances on NO<sub>x</sub> (number of exceedances on the day) were identified on 2(2), 3 (3), 15 (1), 16 (2), 17 (2), 18 (2), 19 (1), 20 (3), 21 (3), 22 (10), 23 (4), 25 (3), 26 (11), 27 (10), 29 (2) and 30 (2) November 2019.

(e) Dates with exceedances on SO<sub>2</sub> (number of exceedances on the day) were identified on 8
 (2), 11 (8), 12 (3), 16 (1) and 23 (1) November 2019.

#### Table 4.5Hourly Average of Parameters Recorded for ASP

Parameter	Range of Hourly Average Conc. (mg/Nm <sup>3</sup> ) <sup>(a)</sup>	Max. Emission Limit (mg/Nm³)	Exceedances Identified	Remarks
Dust (or TSP)	0 -1.0	5	Nil	Nil
Carbon Monoxide	0 - 6	100	Nil	Nil
NOx	0 - 564	200	Identified <sup>(c)</sup>	Modification of the ASP is being arranged with the supplier. The supplier will be on-site to complete the modification and review the ASP operation.
SO <sub>2</sub>	0 - 39	50	Nil	Nil
VOCs (including methane) <sup>(b)</sup>	0 - 17	20	Nil	Nil

				on-site to complete the modification and review the ASP operation.
HCl	0	10	Nil	Nil
HF	0 - 1.0	1	Nil	Nil

#### Notes:

(a) All values refer to an oxygen content in the exhaust gas of 11% and dry basis.

(b) The VOCs emission limit include methane as biogas is adopted as fuel in the combustion process.

#### 4.2 ODOUR

#### 4.2.1 Commissioning Phase Monitoring

No odour patrol was required to be conducted for this reporting period.

#### 4.2.2 *Operation Phase Monitoring*

No odour patrol was required to be conducted for this reporting period.

#### 4.3 WATER QUALITY

#### 4.3.1 Construction Phase Monitoring

No effluent was discharged from the construction activity in the reporting month, hence it was not necessary to carry out effluent discharge sampling for this reporting period.

#### 4.3.2 Operation Phase Monitoring

Effluent discharge was sampled monthly from the Effluent Storage Tank as stipulated in the operation phase discharge licence. The results of the discharge sample is recorded in *Table 4.6*.

#### Table 4.6Results of the Discharge Sample

Parameters	Discharged Effluent Concentration (mg/L)	Discharge Limit (mg/L)	Compliance with Discharge Limit
pH (pH units)	8.20 - 9.77	6-10 (a)	Yes
Suspended Solids (b)	179	800	Yes
Biochemical Oxygen Demand (5 days, 20°) <sup>(b)</sup>	20	800	Yes
Chemical Oxygen Demand (b)	552	2,000	Yes

 <sup>(</sup>c) Dates with exceedances on NO<sub>x</sub> (number of exceedances on the day) were identified 1
 (2), 3 (2), 5 (1), 6 (3), 21 (1), 23 (1), 24 (5), 25 (1) and 28 (2) November 2019.

<sup>(</sup>d) Dates with exceedances on NH<sub>3</sub> (number of exceedances on the day) were identified on 17 (1) and 25 (3) November 2019.

Parameters	Discharged Effluent Concentration (mg/L)	0	Compliance with Discharge Limit
Oil & Grease (b)	<5	40	Yes
Total Nitrogen (b)	47.5	200	Yes
Total Phosphorus (b)	28.9	50	Yes
Surfactants (total) <sup>(b)</sup>	<1.0	25	Yes
Notes:			
<ul><li>(a) Daily Average.</li><li>(b) Effluent sample colle</li></ul>	cted on 7 November 2019		

No exceedance of discharge limit was recorded during the reporting period.

#### 4.4 WASTE MANAGEMENT

#### 4.4.1 Construction Phase Monitoring

Wastes generated from this Project include inert construction and demolition (C&D) materials (public fill) and non-inert C&D materials (construction waste). Construction waste comprises general refuse, metals and paper/cardboard packaging materials. Metals generated from the construction of the Project are also grouped into construction waste as the materials were not disposed of with others at public fill. Reference has been made to the Monthly Summary Waste Flow Table prepared by the Contractor (see *Annex G*). With reference to the relevant handling records and trip tickets of this Project, the quantities of different types of waste generated in the reporting month are summarised in *Table 4.7*.

Month / Year	Quantity						
	Total Inert C&D	Non-inert C&D Materials (b)					
	Materials Generated <sup>(a)</sup>	C&D Materials Recycled <sup>(c)</sup>	C&D Waste Disposed of at Landfill <sup>(d)</sup>	Chemical Waste			
November 2019	0.00 tonnes	0.00 kg	0.00 tonnes	0.00 L			

#### Notes:

(a) Inert C&D materials (public fill) include bricks, concrete, building debris, rubble and excavated spoil. In total, 0.00 tonnes of inert C&D material were generated from the Project. The detailed waste flow is presented in *Annex G*.

- (b) Non-inert C&D materials (construction wastes) include metals, paper / cardboard packaging waste, plastics and other wastes such as general refuse. Metals generated from the Project were grouped into construction wastes as the materials were not disposed of with others at the public fill.
- (c) 0.00 kg of metals, 0.00 kg of papers/ cardboard packing and 0.00 kg of plastics were sent to recyclers for recycling during the reporting period.
- (d) Construction wastes other than metals, paper/cardboard packaging, plastics and chemicals were disposed of at NENT Landfill by subcontractors.

#### 4.4.2 *Operation Phase Monitoring*

Wastes generated from the operation of the Project include chemical waste, wastes generated from pre-treatment process and general refuse <sup>(1)</sup>. Reference has been made to the Monthly Summary Waste Flow Table prepared by the Contractor (see *Annex G*). With reference to the relevant handling records and trip tickets of this Project, the quantities of different types of waste generated from the operation of the Project in the reporting month are summarised in *Table 4.8*.

#### Table 4.8Quantities of Waste Generated from the Operation of the Project

Month / Year	Chemical Waste	Waste Gene Pre-treatme		General Refuse		
	Disposal of at CWTC	Disposed of at Landfill <sup>(a)</sup>	Recycled (b)	Disposed of at Landfill <sup>(a)</sup>	Recycled (c)	
November 2019	1,600 L	451.57 tonnes	0.00 tonnes	3.00 tonnes (d)	0 kg	

Notes:

(a) Waste generated from pre-treatment process and general refuse other than chemical waste and recyclables were disposed of at NENT landfill by sub-contractors.

- (b) Among waste generated from pre-treatment process, 0.00 kg of metals, 0.00 kg of papers/ cardboard packing and 0.00 kg of plastics were sent to recyclers for recycling during the reporting period.
- (c) Among general refuse, 0.00 kg of metals, 0.00 kg of papers/ cardboard packing and 0.00 kg of plastics were sent to recyclers for recycling during the reporting period.
- (d) It was assumed that four 240-litre bins filled with 80% of general refuse were collected at each collection. The general refuse density was assumed to be around 0.15 kg/L.

 Public fill and construction waste may only be generated during maintenance works when there are civil or structural works.

# 5 SITE AUDIT

# 5.1 ENVIRONMENTAL SITE AUDIT

## 5.1.1 *Construction Phase*

Joint site inspections were conducted by representatives of the Contractor and the ET on 6, 15, 19 and 27 November 2019 as required for the construction of the Project. The IEC and ER were present at the joint inspection on 27 November 2019.

The audits checked the implementation of the recommended mitigation measures for air quality, landscape and visual, water quality, waste (land contamination) and hazard-to-life stated in the Implementation Schedule (see *Annex F*).

Follow-up actions resulting from the last site inspections were generally taken as reported by the Contractor.

Key observations during the reporting period are summarised as follows:

6 November 2019

• No particular observation during this inspection.

15 November 2019

• No particular observation during this inspection.

19 November 2019

• No particular observation during this inspection.

27 November 2019

• No particular observation during this inspection.

Other than the above observation, the Contractor has implemented environmental mitigation measures recommended in the approved EIA Report and EM&A Manual.

#### 5.1.2 *Operation Phase*

The monthly inspection of the landscape and visual mitigation measures for the operation phase of the Project on 27 November 2019 covered the operation phase environmental site audit. Joint site inspections was conducted by representatives of the Contractor, ER, IEC and the MT on 27 November 2019 as required for the operation of the Project.

The audits checked the implementation of the recommended mitigation measures for air quality, landscape and visual, water quality, waste (land contamination) and hazard-to-life stated in the Implementation Schedule (see *Annex F*).

Follow-up actions resulting from the last site inspections were generally taken as reported by the Contractor.

Key observations during the reporting period are summarised as follows:

27 November 2019

• No particular observation during this inspection.

Other than the above observations, the Contractor has implemented environmental mitigation measures recommended in the approved EIA Report and EM&A Manual.

# 5.2 LANDSCAPE AND VISUAL AUDIT

Inspection of the landscape and visual mitigation measures for the construction phase of the Project was performed on 15 and 27 November 2019. Inspection of the landscape and visual mitigation measures for the operation phase of the Project was performed on 27 November 2019.

It was confirmed that the necessary landscape and visual mitigation measures during the construction and operation phase as summarised in *Annex F* were generally implemented by the Contractor. No specific observation was found during site inspections on 15 and 27 November 2019. No non-compliance in relation to the landscape and visual mitigation measures was identified during the site audits in this reporting period and therefore no further actions are required. The ET/MT will keep track of the EM&A programme to check compliance with environmental requirements and the proper implementation of all necessary mitigation measures.

# 6 ENVIRONMENTAL NON-CONFORMANCE AND DEFICIENCIES

#### 6.1 SUMMARY OF ENVIRONMENTAL NON-COMPLIANCE AND DEFICIENCIES

Non-compliance of emission limits for CHP and ASP were recorded during the reporting period.

The Contractor has reviewed the organic waste treatment processes (i.e. waste reception, waste pre-treatment, anaerobic digesters, and composting processes) and found that they were operated normally during the reporting period. The Contractor has investigated air pollution control system and the combustion system of the CHP and ASP and identified the following potential causes for the exceedance.

- (a) CHP setting was undergoing fine-tuning for performance optimisation. Therefore, it could not effectively remove NO<sub>x</sub> and VOCs (including methane) at a certain period of time which leads to the exceedance for NO<sub>x</sub> and VOCs (including methane) limit for the CHP stacks;
- (b) Tripping of the circulation pump resulting in the incompletion desulphurisation of biogas which gave rise to exceedances of SO<sub>2</sub> limits for CHP and ASP stacks.
- (c) The ongoing performance optimisation of the ASP result in the incomplete combustion of biogas. The unstable emission leads to the exceedances of  $NO_x$  and  $NH_3$  in ASP.

For item (a), it was arranged with the supplier of CHPs to check the performance of CHPs onsite during the reporting period. The supplier will conduct a detailed investigation of the remaining exceedance recorded on the CHPs. After the investigation, the Contractor will perform the maintenance work according to suggestions raised by the supplier in the next reporting period.

For item (b), routine maintenance of the desulphurisation column, e.g. cleaning of sensors, has been carried out. Continuous monitoring of the desulphurisation column will remain in place to reduce the duration of tripping which causes exceedances in  $SO_2$  in CHP and ASP stacks.

For item (c), parts of the modification works has been completed, with more components waiting to be delivered to Hong Kong. The Contractor has scheduled the remaining modification work for the next few reporting periods with schedule shutdown of the ASP to facilitate the installation of equipment for performance optimisation.

The investigation report is presented in Annex I.

Suspension liquid overflow at the intermediate digestate tank (IDT) was observed at the digestate tank on 5 November 2019.

The investigation report and the extract of the incident report provided by the Contractor are presented in *Annex I*.

Treated effluent leakage was found outside the treated effluent pump room on 23 November 2019.

The investigation report and the extract of the incident report provided by the Contractor are presented in *Annex I*.

The Contractor reported that an incident related to the release of biogas occurred on 25 August 2019. The incident has been resolved. The investigation is still on-going and is expected to be completed in the next reporting period. The investigation of the incident will be included in the next monthly EM&A report.

## 6.2 SUMMARY OF ENVIRONMENTAL COMPLAINT

No complaint was received during the reporting period.

#### 6.3 SUMMARY OF ENVIRONMENTAL SUMMON AND SUCCESSFUL PROSECUTION

No summon/prosecution was received during the reporting period. The cumulative summons/prosecution log is shown in *Annex H*.

# 7 FUTURE KEY ISSUES

# 7.1 KEY ISSUES FOR THE COMING MONTH

Activities to be undertaken for the coming reporting period are:

- Operation of the Project.
- Modification of the AS to control the air emission.
- Visitor Centre BS works (exhibition fixture installation).

#### CONCLUSIONS

8

This EM&A Report presents the EM&A programme undertaken during the reporting period from **1** to **30 November 2019** in accordance with EM&A Manual (Version E) and requirements of EP (FEP-01/395/2010/C).

No air quality, noise and water quality monitoring is required under the construction EM&A requirements.

For the operation phase, exceedances of the emission limits for ASP stack monitoring were recorded under normal operating conditions during the reporting period (see *Table 8.1*).

StackExceedances During the Reporting PeriodCogeneration Unit (CHP)• Exceeded emission limit of NOx on 2, 3, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 29 and 30 November 2019.• Exceeded emission limit of SO2 on 8, 9, 10, 11, 12, 16 and 23 November 2019Ammonia Stripping Plant (ASP)• Exceeded emission limit of NOx on 1, 3, 5, 6, 21, 23, 24, 25 and 28 November 2019• Exceeded emission limit of NH3 on 17 and 25 November 2019

Table 8.1Exceedances for Stack Emissions

Exceedances in emission parameters of ASP were found to be a result of the continuous fine-tuning of ASP setting.

The Contractor has implemented mitigation measures to control the exceedance, which is the modification of the ASP to optimise overall performance.

No non-compliance to the effluent discharge limit was recorded during this reporting period.

The environmental control / mitigation measures related to air quality, water quality, waste (including land contamination prevention), hazard-to-life and landscape and visual recommended in the approved EIA Report and the EM&A Manual were properly implemented by the Contractor during the reporting month.

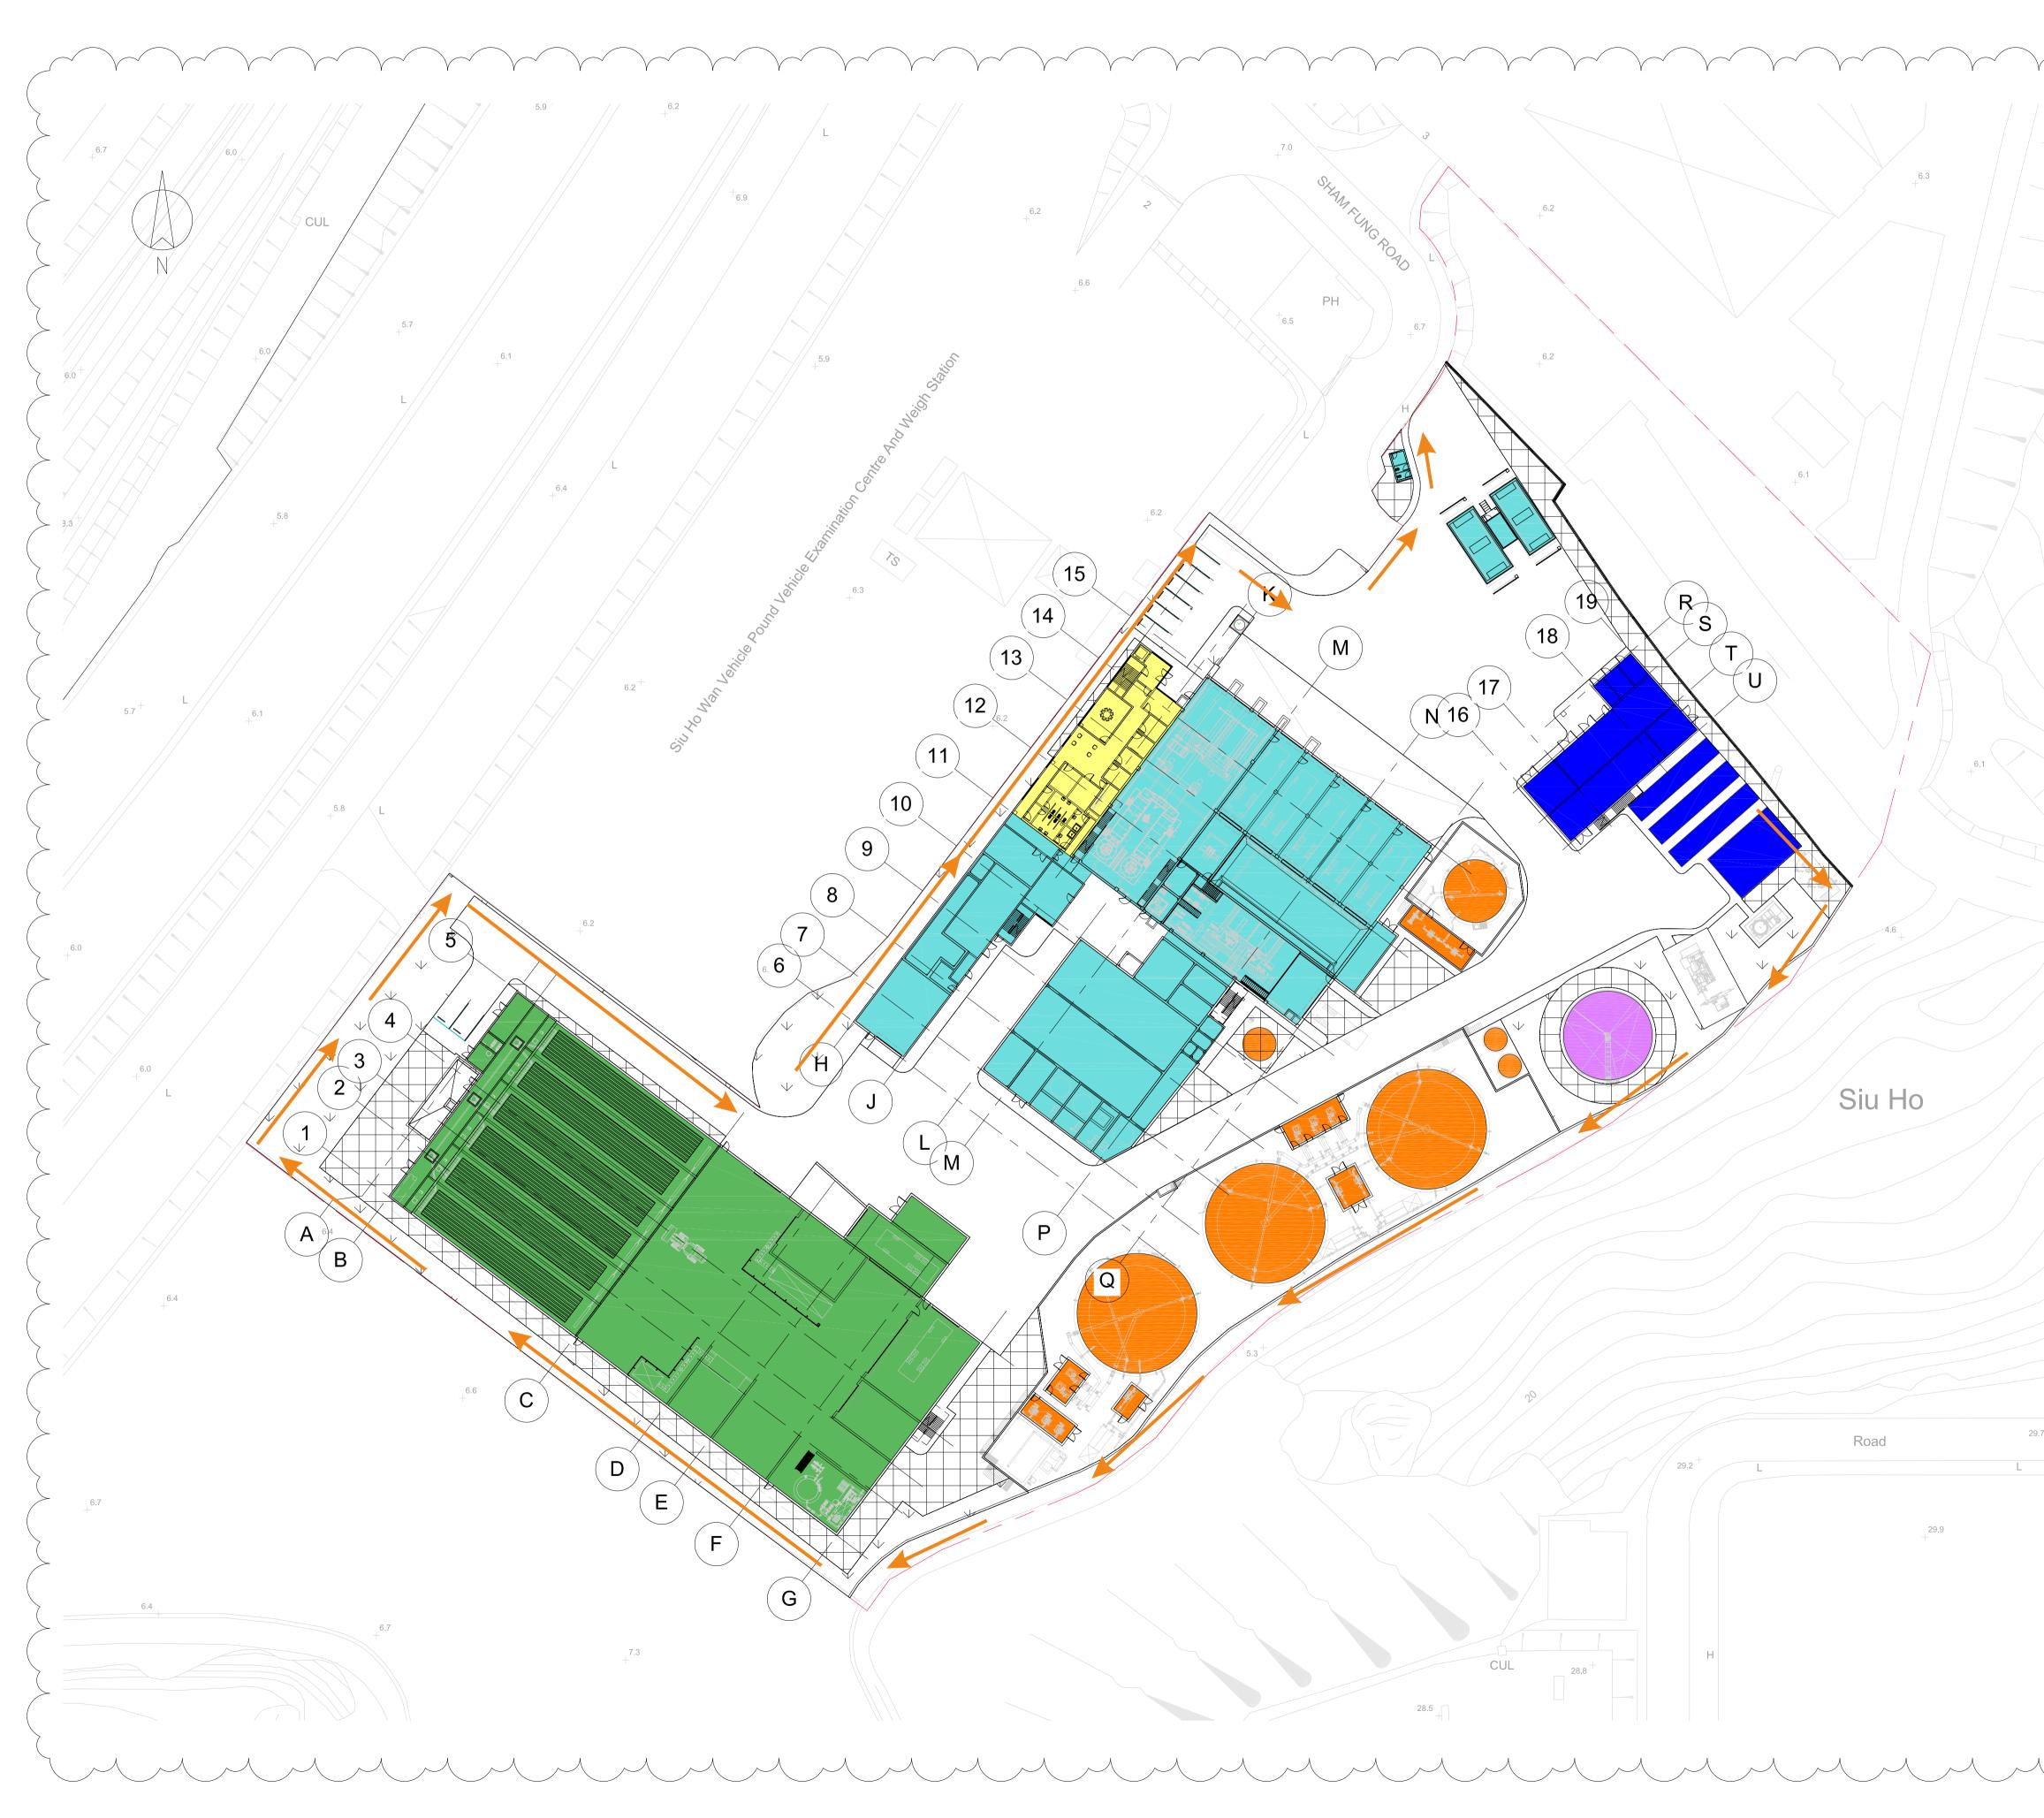

Bi-weekly landscape and visual monitoring were conducted in the reporting period. The necessary landscape and visual mitigation measures recommended in the approved EIA Report were generally implemented by the Contractor.

An incident related to the release of biogas occurred on 25 August 2019. The incident has been resolved. The investigation is still on-going and is expected to be completed in the next reporting period.

No complaint/summon/prosecution was received.

Implementation Schedule of Mitigation Measures Annex F1

Implementation Schedule of Mitigation Measures for Construction Phase

<b>Log Ref.</b> Environmenta <sup>r</sup> Quality	I Milis - Ken Meanway in the FTA and FMCA Menuel		
	1 Milis stien Massennes in the FIA and FMC A Manuel		
r Quality	al Mitigation Measures in the EIA and EM&A Manual		
0 5			
2.5	Air Pollution Control (Construction Dust) Regulation & Good Site Practices	Construction Site / During Construction Period	N
	•Use of regular watering, with complete coverage, to reduce dust emissions from exposed site	Construction renou	
	•Use of frequent watering for particularly dusty construction areas and areas close to ASRs.		
	•Side enclosure and covering of any aggregate or dusty material storage piles to reduce		
	emissions. Where this is not practicable owing to frequent usage, watering should be applied to aggregate fines.		
	•Open stockpiles should be avoided or covered. Where possible, prevent placing dusty material		
	storage piles near ASRs.		
	•Tarpaulin covering of all dusty vehicle loads transported to, from and between site locations.		
	•Establishment and use of vehicle wheel and body washing facilities at the exit points of the		
	site.		
	•Provision of wind shield and dust extraction units or similar dust mitigation measures at the		
	loading points, and use of water sprinklers at the loading area where dust generation is likely during the loading process of loose material, particularly in dry seasons/periods.		
	recommended limit.		
	•Where possible, routing of vehicles and positioning of construction plant should be at the		
	maximum possible distance from ASRs.		
	•Every stock of more than 20 bags of cement or dry pulverised fuel ash (PFA) should be covered		
	entirely by impervious sheeting or placed in an area sheltered on the top and the 3 sides.		
	•Cement or dry PFA delivered in bulk should be stored in a closed silo fitted with an audible		
	high level alarm which is interlocked with the material filling line and no overfilling is allowed.		
	•Loading, unloading, transfer, handling or storage of bulk cement or dry PFA should be carried		
	out in a totally enclosed system or facility, and any vent or exhaust should be fitted with an effective fabric filter or equivalent air pollution control system.		
2	eard to Life	<ul> <li>emissions. Where this is not practicable owing to frequent usage, watering should be applied to aggregate fines.</li> <li>Open stockpiles should be avoided or covered. ## Annex F1 Summary of Mitigation Measures Implementation Schedule for Construction Phase

EIA Ref.	EM&A Log Ref.	Environmental Protection Measures	Location/ Timing	Status
4.102	3.3	Construction Phase	Construction Site / During	$\checkmark$
		•The number of workers on site during construction stage should be kept at the same level as	Construction Period	
		the assessment.		
		•Construction works should be suspended when delivery of chlorine takes place.		
		•3m high fence should be constructed along the boundary facing the SHWWTW.		
		•Emergency evacuation procedures should be formulated and the Contractor should ensure all		
		workers on site should be familiar with these procedures as well as the route to escape in case of gas release incident. Relevant Departments, such as Fire Services Department (FSD), should be consulted during the development of Emergency procedures. Diagram showing the escape routes to a safe place should be posted in the site notice boards and at the entrance/exit of site. A copy of the latest version emergency procedures should be dispatched to Tung Chung Fire Station for reference once available.		
		•The emergency procedures should specify means of providing a rapid and direct warning (e.g.		
		Siren and Flashing Light) to construction workers in the event of chlorine gas release in the SHWWTW.		
		•The Contractor should establish a communication channel with the SHWWTW operation		
		personnel and FSD during construction stage. In case of any hazardous incidents in the treatment works, operation personnel of SHWWTW should advise the Contractor to inform construction workers to proceed with emergency procedure. The Contractor should appoint a Liaison Officer to communicate with FSD Incident Commander on site in case of emergency.		
		•Introduction training should be provided to any staff before carryout construction works at the		
		Project site.		
		•Periodic drills should be coordinated and conducted to ensure all construction personnel are		
		familiar with the emergency procedures. Upon completion of the drills, a review on every step taken should be conducted to identify area of improvement. Prior notice of periodic drills should be given to Station Commander of Tung Chung Fire Station. Joint operational exercise with FSD and SHWWTW is recommended.		
	Vater Quality		1	
5.44	4.5	<u>Construction site run-off and general construction activities:</u> The mitigation measures as outlined in the ProPECC PN 1/94 Construction Site Drainage should be adopted where applicable.	Construction Site / During Construction Period	$\checkmark$

EIA Ref.	EM&A Log Ref.	Environmental Protection Measures	Location/ Timing	Status
5.45	4.5	<u>Excavation of Soil Materials</u> The construction programme should be properly planned to minimise soil excavation, if any, in rainy seasons. This prevents soil erosion from exposed soil surfaces. Any exposed soil surfaces should also be properly protected to minimise dust emission. In areas where a large amount of exposed soils exist, earth bunds or sand bags should be provided. Exposed stockpiles should be covered with tarpaulin or impervious sheets at all times. The stockpiles of materials should be placed at locations away from any stream courses so as to avoid releasing materials into the water bodies. Final surfaces of earthworks should be compacted and protected by permanent work.	Construction Site / During Construction Period	N/A
5.46	4.5	<u>Accidental spillage of chemicals:</u> Contractor must register as a chemical waste producer if chemical wastes would be produced from the construction activities. The Waste Disposal Ordinance (Cap 354) and its subsidiary regulations in particular the Waste Disposal (Chemical Waste) (General) Regulation should be observed and complied with for control of chemical wastes.	Construction Site / During Construction Period	1
5.47	4.5	Maintenance of vehicles and equipments involving activities with potential for leakage and spillage should only be undertaken within the areas which appropriately equipped to control these discharges.	Construction Site / During Construction Period	$\checkmark$
5.48	4.5	Oils and fuels should only be used and stored in designated areas which have pollution prevention facilities. All fuel tanks and storage areas should be sited on sealed areas in order to prevent spillage of fuels and solvents to the nearby watercourses. All waste oils and fuels should be collected in designated tanks prior to disposal.	Construction Site / During Construction Period	N/A
5.49	4.5	<ul> <li>Disposal of chemical wastes should be carried out in compliance with the Waste Disposal</li> <li>Ordinance. The Code of Practice on the Packaging, Labelling and Storage of Chemical Wastes</li> <li>published under the Waste Disposal Ordinance details the requirements to deal with chemical</li> <li>wastes. General requirements are given as follows:</li> <li>Suitable containers should be used to hold the chemical wastes to avoid leakage or spillage</li> <li>during storage, handling and transport.</li> <li>Chemical waste containers should be suitably labeled, to notify and warn the personnel who</li> <li>are handling the wastes, to avoid accidents.</li> <li>Storage area should be selected at a safe location on site and adequate space should be</li> <li>allocated to the storage area.</li> </ul>	Construction Site / During Construction Period	

EIA Ref.	EM&A Log Ref.	Environmental Protection Measures	Location/ Timing	Status
5.50	4.5	Construction solid waste, debris and rubbish on site should be collected, handled and disposed of properly to avoid entering to the nearby watercourses. Stockpiles of cement and other construction materials should be kept covered when not being used. Rubbish and litter from construction sites should also be collected to prevent spreading of rubbish and litter from the site area. It is recommended to clean the construction sites on a regular basis.	Construction Site / During Construction Period	
5.51	4.5	<u>Sewage Effluent</u> The presence of construction workers generates sewage. It is recommended to provide sufficient chemical toilets in the works areas. The toilet facilities should be more than 30m from any watercourse. A licensed waste collector should be deployed to clean the chemical toilets on a regular basis.	Work site/During the construction period	N/A
5.52	4.5	Notices should be posted at conspicuous locations to remind the workers not to discharge any sewage or wastewater into the nearby environment during the construction phase of the project. Regular environmental audit on the construction site can provide an effective control of any malpractices and can achieve continual improvement of environmental performance on site.	Work Site / During Construction Period	$\checkmark$
5.53	4.5	Nullah Decking         To minimize the potential water quality impacts from the nullah reconstruction works, the practices outlined below should be adopted where applicable:         •The proposed works should be carried out within the dry season between October and March when the flow in the open nullah is low.         •The use of less or smaller construction plants may be specified to reduce the disturbance to the nullah bed.         •Temporary storage of materials (e.g. equipment, filling materials, chemicals and fuel) and temporary stockpile of construction materials should be located well away from the nullah and any water courses during carrying out of the construction works.         •Stockpiling of construction materials and dusty materials should be covered and located away from the nullah any water courses.         •Construction debris and spoil should be covered up and/or disposed of as soon as possible to avoid being washed into the nullah and nearby water receivers.         •Construction activities, which generate large amount of wastewater, should be carried out in a distance away from the nullah, where practicable.	Work Site / During Construction Period	N/A

EIA Ref.	EM&A Log Ref.	Environmental Protection Measures	Location/ Timing	Status
		•Construction effluent, site run-off and sewage should be properly collected and/or treated.		
		•Any works site inside the nullah should be temporarily isolated, such as by placing of		
		sandbags or silt curtains with lead edge at bottom and properly supported props to prevent adverse impact on the water quality.		
		•Proper shoring may need to be erected in order to prevent soil/mud from slipping into the		
		nullah and nearby watercourse.		
		•Supervisory staff should be assigned to station		
D. V	Vaste Managem			
6.41	5.4	<u>Good Site Practices</u> Recommendations for good site practices during the construction phase would include:	Work Site / During Construction Period	$\checkmark$
		•Obtain relevant waste disposal permits from appropriate authorities, in accordance with the		
		Waste Disposal Ordinance (Cap. 354) and subsidiary Regulations and the Land (Miscellaneous Provisions) Ordinance (Cap. 28);		
		•Provide staff training for proper waste management and chemical handling procedures;		
		•Provide sufficient waste disposal points and regular waste collection;		
		•Provide appropriate measures to minimize windblown litter and dust during transportation of		
		waste by either covering trucks or by transporting wastes in enclosed containers;		
		•Carry out regular cleaning and maintenance programme for drainage systems, sumps and oil interceptors;		
		•Separate chemical wastes for special handling and disposed of to licensed facility for treatment; and		
		•Employ licensed waste collector to collect waste.		
6.42	5.5	Waste Reduction Measures           Waste reduction is best achieved at the planning and design stage, as well as by ensuring the	Work Site/During Design & Construction Period	N
		implementation of good site practices. Recommendations to achieve waste reduction include:		
		•Design foundation works that could minimise the amount of excavated material to be generated;		
		•Provide training to workers on the importance of site cleanliness and appropriate waste		
		management procedures, including waste reduction, reuse and recycling;		

EIA Ref.	EM&A Log Ref.	Environmental Protection Measures	Location/ Timing	Status
		<ul> <li>Sort out demolition debris and excavated materials from demolition works to recover reusable/ recyclable portions (i.e. soil, broken concrete, metal etc.);</li> <li>Segregate and store different types of waste in different containers, skips or stockpiles to enhance reuse or recycling of materials and their proper disposal;</li> <li>Encourage the collection of aluminium cans by providing separate labelled bins to enable this</li> </ul>		
		<ul> <li>Plan and stock construction materials carefully to minimize the amount of waste to be generated and to avoid unnecessary generation of waste.</li> </ul>		
6.44	5.7	<ul> <li><u>Excavated and C&amp;D Materials</u></li> <li>In order to minimise the impact resulting from collection and transportation of C&amp;D material for off-site disposal, the excavated material arising from site formation and foundation works should be reused on-site as backfilling material and for landscaping works as far as practicable. Other mitigation requirements are listed below:</li> <li>•A WMP, which becomes part of the Environmental Management Plan (EMP), should be prepared in accordance with ETWB TCW No.19/2005;</li> <li>•A recording system for the amount of wastes generated, recycled and disposed of (including the disposal sites) should be adopted for easy tracking; and</li> <li>•In order to monitor the disposal of excavated and C&amp;D material at public filling facilities and landfills and to control fly-tipping, a trip-ticket system should be adopted (refer to ETWB TCW No. 31/2004).</li> </ul>	Work Site/During Design & Construction Period	
6.45 - 6.46	5.8 - 5.9	An EMP should be prepared and implemented in accordance with ETWB TCW No. 19/2005 which describes the arrangements for avoidance, reuse, recovery, recycling, storage, collection, treatment and disposal of different categories of waste to be generated from construction activities. The EMP should be submitted to the Supervising Officer (SO) and Supervising Officer's Representative (SOR) for approval. The EMP should be reviewed regularly and updated, preferably on a monthly basis. A system should be devised to work for on-site sorting of excavated and C&D materials and promptly removing all sorted and process materials arising from the construction activities to minimize temporary stockpiling on-site. The system should be included in the EMP identifying the source of generation, estimated quantity, arrangement for on-site sorting, collection, temporary storage areas and frequency of collection by recycling Contractors or frequency of removal off-site.	Work Site/During Design & Construction Period	√
6.47	5.10	Chemical Waste	Work Site / During	$\checkmark$

EIA Ref.	EM&A Log Ref.	Environmental Protection Measures	Location/ Timing	Status
		Should chemical wastes be produced at the construction site, the Contractor would be required to register with EPD as a Chemical Waste Producer and to follow the guidelines stated in the Code of Practice on the Packaging, Labelling and Storage of Chemical Wastes. Good quality containers compatible with the chemical wastes should be used, and incompatible chemicals should be stored separately. Appropriate labels should be securely attached on each chemical waste (such as explosive, flammable, oxidizing, irritant, toxic, harmful, or corrosive). The Contractor should employ a licensed collector to transport and dispose of the chemical wastes, to either the CWTC in Tsing Yi, or any other licensed facilities, in accordance with the Waste Disposal (Chemical Waste) General) Regulation.	Construction Period	
6.48	5.11	<u>General Refuse</u> General refuse should be stored in enclosed bins or compaction units separated from C&D material. A licensed waste collector should be employed by the contractor to remove general refuse from the site, separately from C&D material. Preferably an enclosed and covered area should be provided to reduce the occurrence of 'wind blown' light material.	Work Site / During Construction Period	√

		with emergency procedure. The Contractor should appoint a Liaison Officer to communicate with FSD Incident Commander on site in case of emergency.		
		• Periodic drills should be coordinated and conducted to ensure all on site personnel are familiar with the emergency procedures. Upon completion of the drills, a review on every step taken should be conducted to identify area of improvement. Prior notice of periodic drills should be given to Station Commander of Tung Chung Fire Station. Joint operational exercise		
C. V	Vater Quality	with FSD and SHWWTW is recommended.		
5.44	4.5	<ul> <li><u>Wastewater from Organic Waste Treatment Process</u></li> <li>The Project site will be equipped with an adequately sized wastewater treatment plant. A high rate type of active sludge system specifically designed for the removal of nitrogen components from the wastewater in combination with conversion of residual BOD and COD would be deployed. The wastewater treatment plant would also be incorporated with SHARON or annamox technology or equivalent to achieve high total overall nitrogen removal. Wastewater generated from the OWTF (including wastewater from dewatering process, leachate from waste reception area, condensate from biogas handling, wastewater from scrubber of air treatment system and any surplus water from truck washing facility) will be diverted to the wastewater treatment plant. Treated effluent will then be stored temporarily in order to be used as process water within the plants. The storage volume would be around 20 m3. Overflow from the tank will be discharged to foul sewers. The polluting parameters in effluent shall be in compliance with the requirements specified in the TM- DSS. The design, installation and operation of the wastewater treatment plant thall be licensed under the Waste Disposal Ordinance and subject to the effluent monitoring as required under the WPCO which is under the ambit of regional office (RO) of EPD. To ensure that wastewater can be adequately treated and effluent from treatment plant can meet the standards listed in TM- DSS, the following mitigation measure should be conducted.</li> <li>Cleaning and maintenance of treatment facilities should be conducted on a regular basis to ensure that removal rate of each treatment facility would not be reduced.</li> <li>Cleaning and maintenance of pipelines should be carried out on a regular basis to prevent block of pipeline and leaching of wastewater, and therefore prevent overflowed or leached wastewater discharging into nearby drainages and water streams.</li> </ul>	Work Site / During Design & Operation Period	
5.55	4.5	Regular site inspection should be conducted to ensure that no wastewater can be directly discharged into nearby water streams. In the scrubber, spraying water should be re-circulated to minimize the need for external water.	Work Site / During Design &	√
		The spraying water would be collected at the bottom of the scrubber. Excess water would be discharged to the wastewater treatment plant as described in Section 5.54.	Operation Period	
5.56	4.5	The waste reception, treatment facilities and compost storages of OWTF should be located in	Work Site / During Design &	$\checkmark$

EIA Ref.	EM&A Log Ref.	Environmental Protection Measures	Location/ Timing	Status
		enclosed buildings to prevent generation of contaminated rain runoff. All surface runoff such as washed water generated in the treatment processes areas should be properly collected and diverted to the on-site wastewater treatment plant as described in Section 5.54.	Operation Period	
5.57	4.5	All drainage system for collection and transferring wastewater generated in the OWTF to the on-site wastewater treatment plant as described in Section 5.54 should be capable of preventing clogging and easy maintenance and cleaning.	Work Site / During Design & Operation Period	$\checkmark$
D. V	Vaste Managen			
6.50	5.12	Good Site PracticesGood operational practices should be adopted to Minimize waste management impacts:• Obtain the necessary waste disposal permits from the appropriate authorities, in accordancewith the Waste Disposal Ordinance (Cap. 354), Waste Disposal (Chemical Waste) (General)Regulation and the Land (Miscellaneous Provision) Ordinance (Cap. 28);• Nomination of an approved person to be responsible for good site practice, arrangements forcollection and effective disposal to an appropriate facility of all wastes generated at the site;• Use of a waste haulier licensed to collect specific category of waste;• A trip-ticket system should be included as one of the contractual requirements andimplemented by the Environmental Team to monitor the disposal of solid wastes at publicfilling facilities and landfills, and to control fly tipping. Reference should be made to ETWBTCW No. 31/2004.• Training of site personnel in proper waste management and chemical waste handlingprocedures;• Separation of chemical wastes for special handling and appropriate treatment at a licensedfacility;• Routine cleaning and maintenance programme for drainage systems, sumps and oilinterceptors;• Provision of sufficient waste disposal points and regular collection for disposal;• Adoption of appropriate measures to minimize windblown litter and dust duringtransportation of waste, such as covering trucks or transporting wastes in enclosed containers;and• Implementation of a recording system for the amount of wastes generated, recycled and	During Operation Period	
6.51	5.13	disposed of (including the disposal sites). <u>Waste Reduction Measures</u> Good management and control can prevent the generation of significant amounts of waste. It is recommended that the following good operational practices should be adopted to ensure waste reduction: <ul> <li>Segregation and storage of different types of waste in different containers, skips or stockpiles to enhance reuse or recycling of materials and their proper disposal;</li> </ul>	During Operation Period	√

EIA Ref.	EM&A Log Ref.	Environmental Protection Measures	Location/ Timing	Status
		<ul> <li>Encourage collection of aluminum cans, plastic bottles and packaging material (e.g. carton boxes) and office paper by individual collectors. Separate labelled bins should be provided to help segregate this waste from other general refuse generated by the work force; and</li> <li>Any unused chemicals or those with remaining functional capacity should be reused as far as practicable.</li> </ul>		
6.52	5.14	Wastes Generated from Pre-Treatment ProcessWastes generated from pre-treatment process should be recycled as far as possible. Wastesgenerated from pre- treatment process should also be separated from any chemical waste andstored in covered skips. The recyclables should be collected by licensed collectors, while the restof the waste should be removed from the site on a daily basis to minimize odour, pest and litterimpacts. Open burning must be strictly prohibited.	Pre-Treatment Process/ During Operation Period	$\checkmark$
6.53-6.56	5.15-5.18	<ul> <li><u>Chemical Wastes</u></li> <li>Chemical waste generated from machinery maintenance and servicing should be managed in accordance with Code of Practice on the Packaging, Labelling and storage of Chemical Wastes under the provisions of Waste Disposal (Chemical Waste) (General) Regulation. The chemical waste should be collected by drum-type containers and removed by licensed chemical waste contractors.</li> <li>Plant / equipment maintenance schedules should be planned in order to minimize the generation of chemical wastes.</li> <li>Non-recyclable chemical wastes and lubricants should be disposed of at appropriate facilities, such as CWTC. Copies or counterfoils from collection receipts issued by the licensed waste collector should be kept for recording purpose.</li> <li>Recyclable chemical waste will be transported off-site for treatment by a licensed collector. The Contractor will need to register with EPD as a chemical waste producer. Where possible, chemical wastes (e.g. waste lubricants) would be recycled at appropriate facilities, such as Dunwell's oil re-refinery.</li> </ul>	Whole Site / During Operation Period	√
6.57-6.58 Е. Р	5.19-5.20	General Refuse         • Waste generated in offices should be reduced through segregation and collection of recyclables. To promote the recycling of wastes such as used paper, aluminum cans and plastic bottles, it is recommended that recycling bins should be clearly labelled and placed at locations with easy access. For the collection of recyclable materials, they should be collected by licensed collectors.         • General refuse, other than segregated recyclable wastes, should be separated from any chemical waste and stored in covered skips. The general refuse should be removed from the site on a daily basis to minimize odour, pest and litter impacts. Also, open burning of refuse must be strictly prohibited.         Contamination Preventive Measures	Whole Site / During Operation Period	√

		minimized.		
		• The storage area should be used for fuel oil storage only.		
		• No surface water drains or foul sewers should be connected to the storage area.		
		• The storage area should be enclosed by three sides by a wall and have an impermeable floor		
		or surface.		
6.65	5.21 (iii)	Fuel Oil Spillage Response	Whole Site / During Operation	$\checkmark$
		An Oil Spill Response Plan should be prepared by the operator to document the appropriate	Phase	
		response procedures for oil spillage incident in detail. General procedures to be taken in case of		
		fuel oil spillage are presented below.		
		• <u>Training</u>		
		Training on oil spill response actions should be given to relevant staff. The training		
		should cover the followings:		
		- Tools & resources to combat oil spillage and fire, e.g. locations of oil spill		
		handling equipment and firefighting equipment;		
		<ul> <li>General methods to deal with oil spillage and fire incidents;</li> <li>Procedures for emergency drills in the event of oil spills and fire; and</li> </ul>		
		<ul> <li>Regular drills should be carried out.</li> </ul>		
		<u>Communication</u>		
		Establish communication channel with the Fire Services Department (FSD) and EPD to		
		report any oil spillage incident so that necessary assistance from relevant department		
		could be quickly sought.		
		<u>Response Procedure</u>		
		Any fuel oil spillage within the Project Site should be immediately reported to the Site		
		Manager with necessary details including location, source, possible cause and extent of		
		the spillage		
		Site Manager should immediately attend to the spillage and initiate any appropriate		
		action to confine and clean up the spillage. The response procedures should include		
		the following:		
		- Identify and isolate the source of spillage as soon as possible.		
		- Contain the oil spillage and avoid infiltration into soil / groundwater and		

EIA Ref.	EM&A Log Ref.	Environmental Protection Measures	Location/ Timing	Status
		<ul> <li>discharge to storm water channels.</li> <li>Remove the oil spillage.</li> <li>Clean up the contaminated area.</li> <li>If the oil spillage occurs during refuelling, the refuelling operation should immediately be stopped.</li> <li>Recovered contaminated fuel oil and the associated material to remove the spilled oil should be considered as chemical waste. The handling and disposal procedures for chemical wastes are discussed in the following paragraphs.</li> </ul>		
6.66	5.22 (i)	<ul> <li><u>Chemicals and Chemical Wastes Handling &amp; Storage</u> <ul> <li>Chemicals and chemical wastes should only be stored in suitable containers in purpose-built areas.</li> <li>The storage of chemical wastes should comply with the requirements of the Code of Practice on the Packaging, Labelling and Storage of Chemical Wastes.</li> <li>The storage areas for chemicals and chemical wastes should have an impermeable floor or surface. The impermeable floor I surface should possess the following properties:                 <ul> <li>Not liable to chemically react with the materials and their containers to be stored.</li></ul></li></ul></li></ul>	Whole Site / During Operation Period	
6.66	5.22 (ii)	Chemicals and Chemical Wastes Spillage Response         A Chemicals and / or Chemical Wastes Spillage Response Plan should be prepared by the operator to document in detail the appropriate response procedures for chemicals or chemical wastes spillage incidents. General procedures to be undertaken in case of chemicals I chemical waste spillages are presented below         • Training         • Training on spill response actions should be given to relevant staff. The training should cover the followings:	Whole Site / During Operation Period	$\checkmark$

# No. EP/SP/61/10 of Organic Resources Recovery Centre (Phase 1) Monthly Summary Waste Flow Table

Notes:

1. General refuse was disposed of at NENT by subcontractors.

2. Metal and paper/cardboard packaging were collected by recycler for recycling.

3. Plastics refer to plastic bottles/containers, plastic sheets/foam from packaging material collected by recycler for recycling.

4. It was assumed that four 240-litre bins filled with 80% of general refuse were collected at each collection. The general refuse density was assumed to be around 0.15 kg/L.

Annex I

Investigation Report

Date	1 - 30 November 2019
Time	Continuous monitoring throughout November 2019
Monitoring Location	Continuous Environmental Monitoring System (CEMS)
Parameter	Various emission parameters of the Cogeneration Unit (CHP)
	Ammonia Stripping Plan (ASP)
Exceedance Description	<ol> <li>Continuous monitoring was carried out at the CHP and ASP throughout the reporting period using the CEMS. According to the EM&amp;A Manual, exceedance is considered if the emission concentration of the concerned pollutants is higher than the emission limits stated in Tables 2.2, 2.3 and 2.5 of the EM&amp;A Manual (Version F) for CAPCS, CHP and ASP respectively. The concentration of the concerned air pollutants were monitored on-line by the CEMS. Exceedances of various emission parameters were recorded on the CEMS including:         <ul> <li>NO<sub>x</sub> and SO<sub>2</sub> in the CHP</li> <li>NO<sub>x</sub> and NH<sub>3</sub> in the ASP.</li> </ul> </li> <li>According to the Contractor, the plant was receiving around 100 tonnes of SSOW daily and was operated normally.</li> <li>Further optimisation of the chemical dosing system of the The Contractor explained that the exceedances recorded in the ASP was because the thermal combustion unit of the ASP still require tuning to optimise the combustion efficiency.</li> </ol>
Action Taken / Action to be Taken	<ul> <li>It was arranged with the supplier of CHPs to check the performance of CHPs onsite during the reporting period. The supplier will conduct a detailed investigation of the remaining exceedance recorded on the CHPs. After the investigation, the Contractor will perform the maintenance work according to suggestions raised by the supplier. The maintenance work is expected to complete in the next reporting period.</li> <li>Parts of the modification works on the ASP has been completed, with more components waiting to be delivered to Hong Kong. The Contractor has scheduled the remaining modification work for the next few reporting periods with schedule shutdown of the ASP to facilitate the installation of equipment for performance optimisation.</li> </ul>
Remedial Works and	The Contractor is recommended to closely monitor the
Follow-up Actions	processes, including the modification work and follow-up
renow up renous	emission monitoring of the ASP to avoid exceedance. MT will carry out follow-up audit regarding the progress next month.

# **Investigation Report of CEMS Exceedances**

OSCAR Bioenergy Joint Venture EP/SP/61/10 - Organic Resources Recovery Centre Phase 1

Prepared by:Bonia Leung, MT RepresentativeDate11 December 2019

Date	5 November 2019
Time	7:45 am
Monitoring Location	Intermediate Digestate Tank (IDT)
Parameter	IDT level
Exceedance Description	Suspension liquid overflow at the intermediate digestate tank
	(IDT) was observed at the digestate tank on 5 November 2019.
	The digestate spilled into the storm water discharge channel,
	and subsequently into the nullah.
Action Taken / Action to be	The Contractor arranged clean-up of the spillage in the nullah
Taken	immediately and stopped the suspension liquid of the IDT
	from overflowing. The Contractor found that the programme
	that controls the IDT was not functioning properly resulting in
	the overflow of digestate at the IDT. In addition, the 3-way
	valve near the IDT was open which did not stop the spillage
	from entering the storm drain system.
Remedial Works and	The Contractor monitors the IDT level closely using CCTV,
Follow-up Actions	enhanced the routine patrol on the IDT and closed the 3-way
	valve to prevent possible leakage to the nullah.

# Investigation Report of Intermediate Digestate Tank Leakage

Prepared by: Bonia Leung, MT Representative

Date 11 December 2019

#### OSCAR Bioenergy Joint Venture EP/SP/61/10 – Organic Resources Recovery Centre Phase 1

# **Extract of the Incident Notification Form on Suspension Overflow at IDT Prepared by the** <u>Contractor</u>

#### Description of the Process

Intermediate Digestate Tank (IDT) is a 30m<sup>3</sup> buffer tank to transfer digestate to the duty centrifuge use. The IDT is provided with liquid level measurements to detect the hydrostatic pressure at the bottom. The second level sensor detects the fill level by radar at the roof area. The digester recirculating / transfer pumps are inhibited by high level in the IDT.

IDT automatic operation is controlled through SCADA. When dewatering operation finishes (the required volume of digestate is processed) the digestate feed pump stops and the duty centrifuge stops after going through a ramp down sequence according to its programmed procedures. Afterwards, a back-flushing cycle of digestate feed pipe can be carried out automatically or manually to clear digestate off the pipeline to avoid release and accumulation of biogas gas within pipelines.

#### Description of the Incident

On 5/11/2019 morning at around 7:50am, black water was found discharging to the nullah from the storm water discharge channel. The team immediate carried out investigation to identify if there had any leakage from the plant. It was found that suspension was overflowed from the overflow tank of IDT to the surface channel inside AD tanks farm. Operation Team immediate contacted the Central Control Room to stop all feedings to the IDT. The suspension was stopped overflowed from the IDT overflow tank immediately.

#### Immediate Corrective Actions

The team immediate arranged to clean up the spillage inside the tank farm, nearby surface channel and around the IDT. A vacuum tanker truck was also immediate arranged to clean up the suspension at the nullah (*Figure 1*). All the cleanup work was completed at around 11:00am. (*Figure 2* and 3)

#### Figure.1 Vacuum tanker was arranged to cleanup the nullah

# OSCAR Bioenergy Joint Venture

#### EP/SP/61/10 - Organic Resources Recovery Centre Phase 1

Figure.2 Completed cleanup of tank farm and nearby surface channels

Figure.3 Complete cleanup of nullah

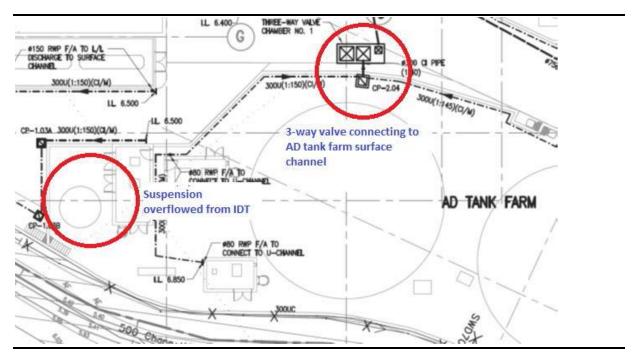

#### Root Cause Analysis

- 1. After the dewatering process, the team started flushing the system. However, the team did not aware that process water was injecting to the IDT.
- 2. Process water will stop injecting to IDT by a default period. However, the process water injection was not stopped. (*To be further investigated by system programmer*)
- 3. The team did not aware the IDT tank was reaching high level and overflowed to the overflow tank
- 4. Process water with residual suspension overflowed from IDT to the overflow tank.
- 5. Process water with residual suspension overflowed to the surface channel at AD tank farm and discharged to the nullah.
- 6. The 3-way valve (*Figure 4*) is believed opened 1-2 months ago because of a heavy rainstorm. The 3-way valve however did not close after the heavy rainstorm.

## OSCAR Bioenergy Joint Venture

#### EP/SP/61/10 – Organic Resources Recovery Centre Phase 1

*Figure.4 Location map of the incident* 

#### Description of Corrective Actions (1)

- 1. Stopped all the feedings to the IDT
- 2. Arranged to clean up the suspension leaked to the nullah by a vacuum tanker truck
- 3. Arranged to clean up the suspension at the surface channel near the IDT

#### Description of Preventive Actions (2)

- 1. To close the 3-way gate valve to prevent possible leakage to nullah (*Figure 5*)
- 2. To keep close monitoring the IDT level for each flushing process (duty suspensor will monitor each flushing process every time with the assistant of CCTV
- 3. To increase the routine patrol frequency by one time per shift to 2 times per shift
- 4. To further investigate by system programmer to check if there have any programming bugs

<sup>(1)</sup> The corrective actions have been closed on 5 November 2019

<sup>(2)</sup> The preventive actions have been closed on 5 November 2019. Continuous monitoring and training to SS and P&C Technician Patrol will be arranged to increase to 2 times per shift in mid Nov 2019. The system checking takes time and is expected to be complete by mid Dec 2019.

# OSCAR Bioenergy Joint Venture EP/SP/61/10 – Organic Resources Recovery Centre Phase 1

Figure.5 Preventive action: AD tank from stormwater 3-way gate valve is closed

Date	23 November 2019
Time	5:30 am
Monitoring Location	Treated Effluent Pump Room
Parameter	Overflow pipeline
Exceedance Description	Treated effluent leakage was found outside the treated
	effluent pump room on 23 November 2019.
Action Taken / Action to be	The Contractor stopped the wastewater discharge to the
Taken	treated effluent tank, arranged sandbags near the outlet and
	arranged for clean-up of the nearby surface channel and the
	road outside the treated effluent pump room. The Contractor
	investigation reported that the overspill of treated effluent was
	caused by the plant power blackout test which cause the
	system to reset the decant process and decanted twice. The
	overflow pipeline was not directly pointed to the drain pit
	which cause the spillage.
Remedial Works and	The Contractor installed a PVC pipe from the overflow pipe
Follow-up Actions	that is directed to the drain pit and erect sandbag wall inside
	the treated effluent pump room.

# Investigation Report of Treated Effluent Leakage

Prepared by: Bonia Leung, MT Representative

Date 11 December 2019

# OSCAR Bioenergy Joint Venture EP/SP/61/10 – Organic Resources Recovery Centre Phase 1

# **Extract of the Incident Notification Form on Treated Effluent Spillage Prepared by the** <u>Contractor</u>

#### Description of the Process

Wastewater generated from plant operation is treated before discharge to Drainage Service Department (DSD) sewage system. Treated wastewater / Treated Effluent is temporary stored inside treated effluent (TE) tank. Treated effluent pump room is equipped with discharge pumps to discharge back to the plant as process recycle water. The tank also equipped with an overflow pipeline in case of high level inside the tank. There is an actuation valve to control the discharge of TE to public sewer. When the level inside the tank reaches a set point (say 40%), the valve will be opened and discharge TE to public sewer.

#### Description of the Incident

On 23<sup>rd</sup> November 2019 around 0530, brown water was found leaked from the treated effluent pump room. It was found that the brown water was leaked from an overflow pipe inside the room. The brown water was treated effluent and also leaked to nearby stormwater channel. The 3-way gate valve was closed a month ago and the leaked treated effluent was considered retain at the stormwater channel.

#### Immediate Corrective Actions

The team immediate stopped the decanting process from SBR (i.e. stopped wastewater discharge to TE tank) and lower the TE tank. Sandbags were also used to control and divert the wastewater to a drain pit inside TE pump room. The team also immediate arranged road sweeper to cleanup nearby surface channel and the road outside TE pump room. The cleanup work was completed at around 6:30am.

# Suspected Incident

At around 8:00am, it was reported that some brown colour water was found at the pit of nullah (*Figure 1*). However, water from the plant's stormwater discharge outlet was clean (*Figure 2*). The team immediately checked the plant and did not find any leakage at that moment. The team therefore double checked the 3-way gate valve and found that the 3-way gate valve was not at "fully closed" position. The brown colour water was suspected leaked during the early morning incident through the 3-way gate valve. It is considered only small amount of TE was leaked to nullah during the early morning incident. This is because most of the overflowed TE was diverted to the drain pit inside the TE pump room and only some of TE end up at the nearby stormwater channel. Moreover, the 3-way gate valve is at an "almost close" position.

#### OSCAR Bioenergy Joint Venture

# EP/SP/61/10 - Organic Resources Recovery Centre Phase 1

Figure.1 Slightly brown colour water at the pit of nullah

Figure.2 Clean water at the stormwater discharge outlet

Root Cause Analysis

- The cause of high level TE was resulted from previous plant blackout test and caused SBR system power down. The system reset the decant process status and decant again. Twice decant caused high level TE.
- 2. The overflow pipeline was not directly pointed to the drain pit inside the TE pump room (*Figure 3*)

OSCAR Bioenergy Joint Venture

EP/SP/61/10 - Organic Resources Recovery Centre Phase 1

- 3. Overflowed TE was discharged on the floor inside the TE pump room rather than to the drain pit
- 4. Small amount of overflowed TE was leaked outside the TE pump room through the gap of the pre-installed sandbags
- 5. A small amount of TE end up at nearby stormwater channel and is suspected leak to the nullah through the "not fully closed" 3-way gate valve.

Figure.3 Misalignment of overflow pipeline to the drain pit inside the TE pump room

# Description of Corrective Actions (1)

- 1. Stopped the decanting process from SBR to TE tank
- 2. Placed sandbags to control and divert the wastewater to a drain pit inside TE pump room.
- **3**. Used road sweeper to cleanup nearby surface channel and the road outside TE pump room.

# Description of Preventive Actions (2)

- 1. To install PVC Pipe to divert the overflow pipeline to the drain pit inside TE pump room
- 2. To place and erect a better sandbags wall inside the TE pump room
- 3. To fully close the 3-way gate valve
- 4. To erect a 200mm height bund wall to prevent similar incidents.
- 5. To review the redesign of the overflow pipeline

<sup>(1)</sup> The corrective actions have been closed on 23 November 2019

<sup>(2)</sup> Items 1 to 3 have been closed on 30 November 2019. Items 4 and 5 are expected to be done in Q1 2020.
