12 Conclusion

12.1 General

In accordance with the EIA Study Brief (No. ESB-276/2014) issued under the Environmental Impact Assessment Ordinance (EIAO) for this Project, an assessment of the potential environmental impacts associated with construction and operation of the Project has been conducted. Environmental issues covered in this EIA include:

- Air Quality Impact
- Noise Impact
- Water Quality Impact
- Sewerage and Sewage Treatment Implications
- Waste Management Implications
- Land Contamination
- Ecological Impact (Terrestrial and Aquatic)
- Landscape and Visual Impacts
- Impact of Hazard to Life

The findings of this EIA study have determined the likely nature and extent of environmental impacts and identified environmental control measures for incorporation into the planning and design of the Project to ensure compliance with environmental legislation and standards during construction and operation phases. The implementation schedule for the recommended mitigation measures are presented in Section 14.

12.2 Summary of Key Environmental Outcomes

12.2.1 Environmental Benefits of the Project and the Environmental Protection Measures Recommended

The police facilities proposed to be co-located at Kong Nga Po under this Project are currently located close to existing and planned residential areas (i.e., Ma Tso Lung Village, residential developments under the North East New Territories New Development Area). The co-location of these scattered police facilities to a centralised location in Kong Nga Po will reduce the number of sensitive receivers affected.

Key environmental protection measures recommended in the EIA during construction phase include:

- Dust suppression measures (e.g. water spraying) for heavy construction activities
- Use of noise barriers, noise enclosures / acoustic shed and noise insulating fabric on noisy plants
- Adopting good site drainage practices as outlined in ProPECC PN1/94
- Adopting waste reduction measures such as sorting C&D materials and recovering reusable / recyclable portions
- Erection and maintenance of temporary protective fence enclosing flora species of conservation interest
- Protection and preservation of unaffected trees within the Project site
- Erection of decorative screen hoarding to screen undesirable views of the construction site

Key environmental protection measures recommended in the EIA during operation phase include:
- 2m to 5m boundary / side walls to alleviate fixed noise impacts
- Restricted helicopter approach/departure flight paths
- Bullet containment systems to reduce lead dust
- Provision of silt removal facilities at storm drains
- Conveyance of sewage to Shek Wu Hui Sewage Treatment Works
- Buffer / roadside tree planting and vertical greening

12.2.2 Population and Environmentally Sensitive Areas Protected

Sensitive areas in the vicinity of the Project have been protected through the avoidance and/or minimisation of environmental impacts due to the construction and operation of the Project. Adverse air quality and noise impacts on sensitive receivers within the study areas have been minimised. Risks associated with existing / planned hazardous facilities in the vicinity (i.e. Sheung Shui Water Treatment Works and Organic Waste Treatment Facility 2) as well as hazardous scenarios of the Project’s facilities risks are all within “Acceptable” level. Furthermore, potential air, noise, hazard and visual impacts on the future population in the proposed residential development under the North East New Territories New Development Area have been avoided as a result of the co-location of the police facilities to KNP.

12.2.3 Recommended Environmental Friendly Designs

During construction phase, works will be conducted in phases to minimise construction dust and noise impacts, and avoid significant visual impact from extensive construction works across the entire Project site. The phasing of construction works will also allow excavated inert construction and demolition (C&D) materials to be stored onsite and reused, minimising the amount to be disposed of at the Government’s Public Fill Reception Facilities. In addition, decorative screen hoarding will be erected along the construction boundary, which will screen undesirable views.

The location of the police facilities have been designed to minimise the landscape footprint and visibility of structures. Furthermore, to minimize the potential visual impact during operation phase, it has been proposed that the form, textures, finishes and colours of the superstructure should be compatible with the existing surroundings. The retaining walls will also be aesthetically enhanced through the use of soft landscape works including tree and shrub planting.

12.2.4 Key Environmental Problems Avoided and Compensation Areas Included

The KNP site has avoided or minimised the following environmental problems:
- No loss of waterbodies / water courses
- No impacts to areas of archaeological interest
- No discharge of treated or untreated sewage effluent into surrounding waterbodies
- No contaminated land affected
- Overall reduction in the number of environmental sensitive receivers
- Reduced number of trees affected
- Less habitats are affected
- Reduction in the total amount of excavated material

Approximately 5,982 new trees will be planted as compensation of the trees recommended for felling and part of the mitigation measures for the Project, which will cover around 5.54ha of land. The mitigation planting will utilise native species and will form an almost continuous buffer around the periphery of the Project Site.

12.3 Air Quality Impact

12.3.1 Construction Phase

Potential air quality impacts from the construction works of the Project would mainly be related to construction dust from site formation, foundation works, excavation, and improvement works of existing Kong Nga Po Road. With proper implementation of the recommended mitigation measures, it has been assessed that all identified ASRs are predicted to comply with the TSP Environmental Impact Assessment – Technical Memorandum (EIAO-TM) criterion as well as the relevant AQOs for RSP and FSP. Hence, there is no adverse air quality impacts anticipated due to the Project during the construction phase.

12.3.2 Operation Phase

During the operation phase, based on the cumulative vehicular and chimney emission modelling results, it is concluded that all the identified ASRs would be in compliance with the AQOs for hourly NO$_2$, annual NO$_2$, daily RSP, annual RSP, daily FSP and annual FSP. No significant operational phase air quality impact from the proposed helipad is expected. With implementation of the practical mitigation measures, impacts of dust, lead dust are anticipated to be localised within the firing ranges. Accumulation of air pollutants at the proposed firing ranges leading to exceedance of the relevant air quality criteria is therefore not anticipated. The findings from the odour patrol and test results obtained on two typical hot and dry sunny days show that the potential cumulative odour impacts at all ASRs due to the three existing pig farms, the existing San Uk Ling Firing Range, the proposed OWTF2 and the proposed firing ranges of the Project would be insignificant. Hence, no adverse air quality impacts are anticipated during the operation phase.

12.4 Noise Impact

12.4.1 Construction Noise

The construction noise impact assessment has been conducted based on the best available information (taking into account other concurrent projects). With the implementation of the mitigation measures in form of quieter plant, movable barriers, noise enclosures and noise insulating fabric, the construction noise
levels at all NSRs are predicted to comply with the noise standards stipulated in the EIAO-TM. Adverse construction noise impacts are therefore not anticipated in this project.

12.4.2 Road Traffic Noise

The potential road traffic noise impacts have been assessed based on the peak traffic flows in 2038. The predicted road traffic noise levels at all representative NSRs would comply with the relevant noise criteria. Thus, no adverse road traffic noise impact is anticipated.

12.4.3 Fixed Noise Sources

Noise impact from planned fixed noise sources could be effectively mitigated by implementing appropriate noise control measure at source during the detailed design stage. By installing at least 2.5m height perimeter wall / boundary wall at the Project site and extra 5m height 4-side walls at Ma Tso Lung firing range as well as the adoption of the maximum permissible SWLs for the proposed fixed plants (i.e. ventilation openings, sewage pumping station and petrol/diesel filling station), the impact noise levels at all representative NSRs complies with the relevant fixed noise criteria. Therefore, adverse fixed noise sources impact to the nearby NSRs is not anticipated.

12.4.4 Helicopter Noise

The helicopter noise impact assessment has been conducted based on the best available information. After adopting the design and operation measures as confirmed with GFS which includes treatment at source, restricting approach / taking-off flight paths and flight angles, and implementing at least 2.5m height perimeter wall / boundary wall at Project site, the predicted helicopter noise levels at all representative NSRs do not exceed the day-time helicopter noise standard laid down in Annex 5 of the EIAO-TM for both scheduled flight and emergency flight. The planned helipad at KNP from 7pm to 7am is for emergency use only and there will not be any scheduled flight during evening and night-time periods. The frequency of using the existing Lo Wu Range helicopter landing site from 7pm to 7am in Year 2010 – 2015 for emergency use is only 3 in total. The duration of each emergency use was about 7 minutes. The helicopter noise impact would comply with the relevant day-time noise criterion of $L_{\text{max}} 85$ dB(A) at all representative NSRs. No residual helicopter noise impact is anticipated.

12.5 Water Quality Impact

12.5.1 Construction Phase

During construction phase, potential water quality impacts associated with the Project include construction site runoff and general construction activities, accidental spillage of chemicals, sewage from the construction workforce and construction works in close proximity to inland watercourses. Mitigation measures have been recommended to ensure no adverse water quality impacts including the implementation of good site practices as outlined in ProPECC Note PN1/94 and ETWB TC (Works) No. 5/2005, proper storage of chemicals in accordance with the Code of Practice on the Packaging, Labelling
and Storage of Chemical Wastes, provision of portable toilets for the construction workforce and temporary diversion of existing drainage culverts. With the recommended mitigation measures in place, no adverse water quality impacts are expected during construction phase.

12.5.2 Operation Phase

During operation phase, potential water quality impacts associated with stormwater runoff and accidental spillage of chemicals will be adequately mitigated with implementation of silt traps in the stormwater drainage system and appropriate containment and storage of chemicals. For refuelling activities, there shall either be no drainage system in the vicinity or the drainage system will be connected to the foul sewerage system. Similarly, runoff generated by the Police Driving and Traffic Training Facilities (PD&TTF) will be managed through the installation of silt traps and petrol interceptors. Sewage generated during operation phase will be conveyed to the Shek Wu Hui Sewage Treatment Works (SWHSTW) for treatment, while the risk of emergency discharge of untreated effluents from the on-site sewage pumping station (SPS) will be minimised through provision of a retention tank and standby pumps as part of the system. With the recommended mitigation measures in place, no adverse water quality impacts are expected during operation phase.

12.6 Sewerage and Sewage Treatment Implications

The Project site is not currently served by a public sewerage connection and the existing septic tank facility is not considered to be sufficient to accommodate the sewage flows generated by the Project, hence conveyance to SHWSTW is required. The sewage flows from the Project are estimated to be 1.74 l/s ADWF and 10.42 l/s peak flow.

The conveyance of these sewage flows to the SHWSTW will be facilitated through the connection of a new on-site SPS and sewer pipeline to connect to the planned communal sewer with OWTF2, before discharging to existing sewerage facilities (PS3 and associated rising main) along Man Kam To Road. The planned communal sewer will be implemented by either this Project or by OWTF2 project (subject to further liaison between CEDD and EPD during detailed design stage) while upgrades to the existing facilities will be managed under a separate contract (CE1/2015(DS)) by DSD, with agreement that the upgrades will take into account the combined additional sewage flows generated by the Project and the OWTF2. The treatment capacity of SWHSTW will be increased under its Phase 1A expansion and will have sufficient treatment capacity for the Project-related sewage flows by the time of operation in 2022. With implementation of the proposed new sewerage facilities and upgrades to existing facilities (by others), adverse sewerage impacts are not anticipated as a result of the Project.

12.7 Waste Management Implications

12.7.1 Construction Phase

The major waste types generated by the construction activities will include construction and demolition (C&D) materials from site clearance, site formation works, foundation works, retaining walls and slope
works, building construction and superstructure works, and road improvement works; chemical waste from maintenance and servicing of construction plant and equipment and general refuse from the workforce. Provided that all these identified wastes are handled, transported and disposed of in strict accordance with the relevant legislative and recommended requirements and that the recommended good site practices and mitigation measures are properly implemented, no adverse environmental impact is expected during the construction phase.

12.7.2 Operation Phase

During the operation phase, the key waste types generated will include general refuse from staff and trainees within Project; chemical waste from regular maintenance activities for some firing range structures and petrol and diesel filling activities for the police vehicle fleet; as well as cartridge casings and bullet heads from firing and training activities. Provided that all these wastes are handled, transported and disposed of in strict accordance with the relevant legislative requirements and the recommended mitigation measures are properly implemented, no adverse environmental impact is expected during the operation phase.

12.8 Land Contamination

12.8.1 Construction Phase

The land contamination assessment has been conducted by reviewing the historical and current land uses, desktop appraisal and site reconnaissance survey with respect to the potential land contamination at the Study Area. Other relevant information collected from the related government departments has been reviewed.

Based on the findings of the desktop appraisal of the historical and current land uses and the site survey in the Study Area, land contamination impacts associated with construction of the Project is not anticipated.

In case contaminated materials are discovered after the commencement of works, mitigation measures for handling of contaminated materials and regular site audits are recommended to minimise the potential adverse impacts on workers’ health and safety and remediation/ disposal of potentially contaminated materials.

12.8.2 Operation Phase

The planned land uses within the Project will mainly include firing training, weapons training, driving and traffic training. All cartridge casing and bullet heads will be collected from the firing range after each target practice and stored in the storeroom for disposal. Therefore, no contaminated land issue is anticipated during training activities.

A petrol/ diesel filling station will be provided in the PD&TTF. Spills and leaks from underground storage tanks and pipework may pose potential land contamination issues. With the recommended mitigation
measures in place, no land contamination would be expected to arise and no adverse impacts are anticipated.

Mobile oil refuelling truck for refuelling of helicopters will be required under some specific operational need. The refuelling activities will be carried out at the helipad. With the recommended mitigation measures in place, no land contamination would be expected to arise and no adverse impacts are anticipated.

12.9 Ecological Impact

The Project site comprises of five habitat types including plantation, grassland, grassland/shrubland, developed area and orchard. Amongst these habitat types, grassland is dominant in the Project site. Although several flora and fauna species of conservation interest were recorded within the Project site, the area is generally not ecologically significant owing to the relatively low ecological value of the habitats. Grassland habitat is common in the Study Area and this habitat is also the dominant habitat at the periphery of the Project Site. Therefore, the potential direct impact on habitat loss is considered as of moderate-minor to minor significance. Indirect impact on off-site habitat is also not considered to be significant due to lack of important ecological resources. No significant ecological impact will be resulted from the operation of the Project as all potential air quality, noise and water quality impacts will be controlled to environmentally acceptable levels, thus no specific ecological mitigation measure is considered necessary.

To minimise impact on the flora species of conservation interest within the Project site, it is recommended to conduct a detailed vegetation survey as baseline monitoring to update the exact locations, number and condition of individuals of any flora species of conservation interest within the proposed works area prior to the commencement of site clearance. Erection and maintenance of a temporary protective fence enclosing the flora species of conservation interest to be preserved is recommended to avoid potential impact from construction activities. A proper transplantation proposal should be prepared and implemented if individuals of flora species of conservation interest are identified not preserved on site. Monthly monitoring of any other flora species of conservation interest identified in the detailed vegetation survey should be conducted during the construction phase to preserve those flora species of conservation interest recorded within the Project site.

With consideration of minimizing impact on rare butterfly species of conservation interest recorded at the grassland in the Project site, it is recommended to consider inclusion of some common grass species which are the larval food plants of Small Three-ring and Swallowtail in the proposed vegetation planting or the Landscape Master Plan in order to benefit these species.

12.10 Landscape and Visual Impacts

The proposed development will see a complete change in the landscape of the Project site, transforming it from a rural albeit disturbed landscape into a large institutional facility. The proposals include extensive site formation works, including significant retaining walls and the introduction of new building forms into a landscape currently characterised by smaller scale and fine textured development contained within a
setting of hills and large areas of woodland. Many of the areas which surround the site are typical open
storage and light industrial uses which have replaced more traditional agricultural uses.

The future landscape context represented by the planning framework including OZPs and the projects
identified as part of the assessment of cumulative impacts will be a much more developed setting. As
such, the Project will be in-tune with this future setting.

It should be noted that despite the coverage of grassland, shrubland and plantation woodland, the Project
site is a degraded landscape shaped by the previous engineering requirements for a borrow site. The
design of the site formation proposals have sought to be as sensitive as possible, given the functional
requirements, to the existing landscape setting. This includes lowering the development platform and
hence the height of the retaining structures at the periphery of the site through a number of design
iterations and the design and disposition of the proposed buildings and structures to minimise their impact
on surrounding landscape character and visual amenity. The landscape and visual mitigation proposals
are centred on the use of extensive woodland planting around the periphery of the site to form a landscape
buffer. This buffer will screen low-level views (the majority of the existing VSRs are low-level) and integrate
the proposed works within the existing landscape framework in more elevated views.

Given the design of the proposed works, the likely impacts on landscape resources during the design year
(Year 10) will range from moderate adverse to slight beneficial; and for landscape character the impacts
are largely slight adverse to insubstantial although there will be moderate adverse impacts on the Kong
Nga Po Upland landscape. Although visual impacts range from moderate to slight adverse, it should be
noted that owing to the rural nature of the existing setting, these views are only available to a relatively few
people. The level of residual landscape and visual impacts is directly linked to the effectiveness of the
proposed mitigation measures.

In accordance with the criteria and guidelines for evaluating and assessing impacts as state in Annex 10,
Clause 1.1(c) of the EIAO-TM, overall, it is considered that the residual landscape and visual impacts of
the proposed development are acceptable with mitigation during the construction and operation phases.

12.11 Impact of Hazard to Life

A hazard-to-life assessment was carried out for the Proposed Police Facility in Kong Nga Po. The potential
impacts from nearby PHI to the Project, as well as the risk impact by the transport, storage and use of
helicopter fuel and other DGs were analysed. By carrying out Quantitative Risk Assessment on the
facilities, it can be concluded that the overall risk (in terms of individual risk and societal risk level) satisfy
the requirement as stipulated in the Annex 4 of the Technical Memorandum of Environmental Impact
Assessment Ordinance, and no risk mitigation measure is necessary. Recommendations / good practices
are proposed to ensure the safe operation of the proposed police facilities.
12.12 Summary of Environmental Impacts

A summary of environmental impacts for each individual impact in the EIA report is presented in Table 12.1.
Table 12.1: Summary of Environmental Impacts of Police Facilities in Kong Nga Po

Air Quality Impact:

- Air Quality Impact
- Air Quality Impact
- Compliance with the AQO for hourly TSP, daily RSP under Tier 1 mitigated scenario and for daily FSP under Tier 1 unmitigated scenario.
- Compliance with the AQO for annual RSP and annual FSP under mitigated scenario.
- Compliance with the AQO for annual hourly NOx, daily and annual RSP, and daily and annual FSP.

Operation Phase:

- Operation Phase
- Technical Memorandum on Environmental Impact Assessment Process (EIAO-TM) (Environmental Impact Assessment Ordinance (EIAO); Cap. 499.516), EIAO-TM, Annexes 4 and 12; and
- Air Pollution Control Ordinance (APCO) (Cap. 311) and the Air Quality Objectives (AQO).

Construction Phase:

- With the mitigation measures in place, the predicted cumulative hourly TSP, daily and annual RSP and daily and annual FSP levels at all ASRs would comply with the relevant hourly TSP criterion as well as the relevant AQO for daily and annual RSP and FSP.
- Operation Phase
- Based on the modelling results, it is predicted that all the identified ASRs would be in compliance with the AQOs for daily RSP, annual RSP, daily FSP, annual FSP, hourly NOx, and annual NOx.

Mitigation Measures Proposed:

- Use of regular water spraying (once every 1.25 hours or 8 times per day) to reduce dust emissions from heavy construction activities (including ground excavation, earth moving, etc.) at all active works area, exposed site surfaces and unpaved roads, particularly during dry weather.
- Dust control practices as stipulated in the Air Pollution Control (Construction Dust) Regulation.

Residual Impacts after Mitigation:

- No residual impacts anticipated due to the project development during the construction phase.
- Residual impact is not anticipated.

### Construction Phase

- No adverse water quality impacts are expected as a result of general construction activities;
- No adverse water quality impacts are anticipated as a result of site runoff;
- No adverse water quality impacts are expected as a result of accidental spillage of chemicals;
- No adverse water quality impacts are anticipated from sewage generated by the construction workforce; and
- No adverse water quality impacts are predicted by construction works in close proximity to inland watercourses.

#### Construction Phase

- Connection of Project site to the existing sewerage system and SWHSTW for treatment avoids the need for an on-site STW (and associated discharges to adjacent WSRs).

#### Construction Phase

- Appropriate storage of construction materials and waste;
- Adoption of good site practices outlined in ProPECC Note PN1/94;
- Appropriate storage and labelling of chemicals;
- Regular maintenance and licensed disposal of sewage from portable toilets; and
- Temporary diversion of existing drainage culverts and other measures stipulated in ETWB TC (Works) No. 5/2005.

#### Operation Phase

- Regular maintenance of silt removal and petrol interceptor facilities;
- Appropriate storage and labelling of chemicals, oils and fuels;
- In refuelling areas, either (i) no stormwater drainage is to be installed, or (ii) petrol interceptors are to be installed with downstream connection to the foul sewerage system;
- Conveyance of sewage to SWHSTW for treatment; and
- Buffer capacity through standby pumps and retention tank at the on-site SPS.

#### Operation Phase

- No residual impacts are anticipated.
### Waste Management Implications

#### Study Area

**Construction Phase**
- Inert construction and demolition (C&D) materials of about 600,000m³ and non-inert C&D materials of about 3,000m³ will be generated from site formation; foundation, retaining walls and slope work, building construction and superstructure works as well as road improvement works;
- General refuse of maximum daily arising of up to 260kg from construction workforce;
- Small quantity of chemical waste from maintenance and servicing of construction plant and equipment.

**Operation Phase**
- About 170 kg/day of general refuse will mainly be generated from training activities and restaurants;
- Chemical waste from maintenance activities for some tiring range structures and petrol and diesel filling activities for police vehicle fleet at PDM&TF; and
- About 7,000 kg of cartridge casings and bullet heads will be generated from firing and training activities per year.

**Annealed / 15 of EIAO TM**
- Waste Disposal Ordinance (Cap. 354);
- Waste Disposal (Chemical Waste) (General) Regulation (Cap. 354C);
- Waste Disposal (Charges for Disposal of Construction Waste) Regulation (Cap. 354A);
- Public Cleansing and Prevention of Nuisances Regulation (Cap. 328K); and
- Land (Miscellaneous Provisions) Ordinance (Cap. 28).

**Impact Avoidance Measures Considered**
- Annexes 7 and 15 of EIAO TM
- Waste Disposal Ordinance (Cap. 354);
- Waste Disposal (Chemical Waste) (General) Regulation (Cap. 354C);
- Waste Disposal (Charges for Disposal of Construction Waste) Regulation (Cap. 354A);
- Public Cleansing and Prevention of Nuisances Regulation (Cap. 328K);
- and
- Land (Miscellaneous Provisions) Ordinance (Cap. 28).

**Mitigation Measures Proposed**
- Minimise site excavation for site formation works and retaining structure and minimise the amount of excavated materials to be generated.

**Residual Impacts after Mitigation**
- No residual impacts would be anticipated.

#### Land Contamination

**Construction Phase**
- The land contamination assessment has been conducted by reviewing the historical and current land uses, desktop appraisal and site reconnaissance survey with respect to the potential land contamination at the Study Area.
- Land contamination impacts associated with the construction of the proposal project is not anticipated.

**Operation Phase**
- Cartridge casing and bullet heads will be generated from firing training and weapons training activities.
- Spills and leaks maybe occurred from underground storage tanks and pipework of petrol/diesel filling station.

**Guidance Note for Contaminated Land Assessment and Remediation;**
- Guidance Manual for Use of Risk-based Remediation Goals for Contaminated Land Management; and
- Practice Guide for Investigation and Remediation of Contaminated Land.

**Impact Avoidance Measures Considered**
- Section 3 of Annex 19 of EIAO TM:
- Guidance Note for Contaminated Land Assessment and Remediation;
- Guidance Manual for Use of Risk-based Remediation Goals for Contaminated Land Management; and
- Practice Guide for Investigation and Remediation of Contaminated Land.

**Mitigation Measures Proposed**
- The design engineer should adhere to relevant design standards for storage tank and pipework;
- Regular inspections and maintenance should be performed;
- Underground fuel storage tank should be placed within a concrete pit;
- Refuelling service area should be concrete paved;
- Spill control materials and equipment should be provided on site (e.g. absorbent materials, goggles, protective masks, nitrile gloves, disposal bags etc.);
- If the fuel leakage or spillage occur during refuelling activities, the activities should be immediately stopped; and
- Fuel leakage or spillage should be contained and cleaned up immediately.

**Residual Impacts after Mitigation**
- No residual impacts would be anticipated.

### Ecological Impact

**Habitats, flora and fauna within 500m**
- Moderate-minor impact for the loss of grassland habitat and disturbance to

<tr>
<td>The main impacts will be to the landscape resources and character of the project site which undergo a complete change from a partially restored borrower site to a new institutional facility. Based on broad-brush tree survey 5717 nos. trees of the 8726 trees surveyed will be in conflict with the proposals and recommended for felling. In addition 152 dead trees would be removed. Approximately 11.1 ha of grassland in the Project site and alongside Kong Nga Po Road would be lost due to the proposed works. Owing to the nature of the landscape there will also be some indirect impacts on landscape character of the local area particularly during the construction phase. Although views are available to relatively few people there will be significant visual impacts for some VSRs given the scale and visual prominence of the Kong Nga Po development.</td>
