Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.

(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"

(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO_2 and 80% of RSP and it is assumed that there is 7.5% NO_2 among NOx from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:
(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.
(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"
(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO2 and 80% of RSP and it is assumed that there is 7.5% NO2 among Nox from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:
(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.
(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"
(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO2 and 80% of RSP and it is assumed that there is 7.5% NO2 among Nox from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.

Notes:

Notes:
(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO2 and 80% of RSP and it is assumed that there is 7.5% NO2 among Nox from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.
(4) It is assumed that APS also has a 80% removal efficiency on FSP.

Notes:
(1) The calculation is referenced to "Appendix 4.8 - Details of Emission from Portals and Ventilation Buildings and Calculations" of the approved CKR EIA report.
(2) Emission factors and Traffic flow are listed in "Appendix 3.3 - Vehiclar Emission factor"
(3) The Air Purification System (APS) installed in CKR ventilation system can remove 80% of NO2 and 80% of RSP and it is assumed that there is 7.5% NO2 among Nox from the tailpipe emission according to EPD's Guidelines on Choice of Models and Model Parameters.
(4) It is assumed that APS also has a 80% removal efficiency on FSP.

Notes:

(1) BO_MRATE: Total maximum hourly fuel consumption rating of boiler gas oil in litre/hr
GO_MRATE: Total maximum hourly fuel consumption rating of light gas oil in litre/hr

(2) Chimney information for ID 2035-2057 is extracted from the approved KTD EIA report.

(3) SO_2 and Fugitive Emission from Chimney ID 2049, 2054-2057 are based on SP License (No. L-8-004(1)) and to be 0.

(4) According to Table 1.3-1 of USEPA AP-42, the emission factor of fuel type "Distillate Oil fired" under "Boilers < 100 Million Byu/hr" are adopted in this assessment. The emission factors of NOx and RSP are 20 and 2 lb/10^3 gal. Given max sulphur content of industrial fuel as 0.005%, the emission factors of SO_2 is 142*0.005 = 0.71 lb/10^3 gal.

(5) Emission Rate of FSP is assumed to be equal to that of RSP as a conservative approach.

(6) Sample Calculation of Emission Rate (for ID1035): SO_2: 162 * 0.71 * 0.12 / 3600 = 0.0038; NOx: 162 * 20 * 0.12 / 3600 = 0.108; RSP or FSP: 162 *2* 0.12 / 3600 = 0.0108, 0.12 is conversion factor from lb/10^3 gal to kg/10^3L.

(7) General load factors of 41% during day time and 23% during night time are recommended by EPD and were employed for this assessment. (Comprehensive Feasibility Study for The Revised Scheme of South East Kowloon Development EIA 2001; Planning and Engineering Feasibility Study for Sham Tseng Development EIA 2002; Construction of Cycle Tracks and the associated Supporting Facilities from Sha Po Tsuen to Shek Sheung River 2008)

Appendix 3.6

Calculation of Emissions from Cruise Terminal

Marine Emissions from Cruise Terminal

1. With reference to the approved EIA study "Kai Tak Development" 2008 (KTD EIA), the emission sources in Kai Tak Cruise Terminal includes two cruise ships and the tugboats which are used to assist cuisse vessels during berthing. The emission rate from cruise ships and tugboats are calculated from their engine power and the fuel type.

2. The methodology of marine emission in KTD EIA is based on the approach stipulated in "Current Methodologies and Best Practices in Preparing Port Emission Inventories, Final Report, January 2006" prepared by ICF Consulting for USEPA (ICF2006). In April 2009, USEPA updated the final report and named as "Current Methodologies in Preparing Mobile Source Port-related Emission inventories, Final Report" (ICF2009). The related emission factors have been updated.

3. Based on the "Study on Marine Vessels Emission Inventory" which is published by Institute for the Environment, The Hong Kong University of Science & Technology, the weighted fuel sulphur content of residual oil used in the ocean going vessels (OGVs) trend to be decreasing. The average sulphur content of vessel oil is adopted as 3.8% in the calculation of KTD EIA and was down to be 2.8% in the calculation of the approved EIA study for "Kai Tak Development – Roads D3A & D4A" in 2012. From the authority press release on 11th March 2015, the newest average sulphur content used by OGVs in Hong Kong is 2.6%[1].

4. "Air Pollution Control (Marine Light Diesel) Regulation" (Cap. 311Y) started to operate from 2014. The local vessels in Hong Kong are required to use the fuel of marine light diesel which has a sulphur content not exceeding 0.05% by weight.

5. The newest "Air Pollution Control (Ocean Going Vessels) (Fuel at Berth) Regulation" (Cap. 311 AA) has been passed in March 2015 and will operate on 1st July 2015. The OGV will be required to switch-over to low-sulphur fuel (not exceeding 0.5%) except for the first hour after berthing and the last hour before departure. Therefore, in this assessment, the OGVs are proposed to use the fuel with sulphur contents of 0.5% in the hotelling mode and 2.6 % in the berthing mode.

6. As the emission factors and fuel qualities have been changed from approved KTD EIA, the emission from the cruise ships and tugboats are reviewed and re-calculated in this section.

Cruise

7. According to KTD EIA, four size class of cruise ships would berth in Kai Tak Cruise Terminal. The largest power one is Panamax vessels and therefore the worst case should be that the two cruise ships berthing space are used by two Panamax vessels. Their corresponding stack height, emission temperature, exhaust velocity and stack diameter are 48 mPD, 537k, 24.6m/s and 1.9 m. The basic information of the main engine, auxiliary engine and boiler for cruise ships are listed in **Table 1**.

[1] New regulation to require ocean-going vessels to switch to clean fuel while at berth
http://www.info.gov.hk/gia/general/201503/11/P201503110549.htm

Table 1 Engine Information of OGV – Panamax-Queen Elizabeth II

Information	Engine Power (kw)	Operation	Load Factor
Main Engine	88000[1]	Manoeuvring	0.02[2]
Auxiliary Engine	14843.75 [1]	Manoeuvring	0.8 [3]
		Hotelling	0.64 [3]
Boiler	1000 [4]	Hotelling	-

1. Refer to Appendix 6.4 in the approved KTD EIA
2. Refer to Section 2.5 of USEPA: Current Methodologies in Preparing Mobile Source Port-Related Emission Inventories (ICF2009): Load Factor = (Actual Speed / Maximum Speed)^3, or minimum of 2%, $(4/21.5)^3$ is less than 2% so that 2% is adopted.
3. Refer to Table 2-7 of USEPA ICF2009
4. Refer to Table 2-17 of USEPA ICF2009.

8. Nitrogen dioxide (NO_2); sulphur dioxide (SO_2), respirable suspended particulates (RSP (PM_{10})) are the main pollutants from the ocean passenger cruise. The emission factor and emission rate for OGVs are shown in **Table 2**.

Table 2 Emission Factor and Emission Rate for OGV

Parameter		Main Engine[1]	Auxiliary Engine[2]		Boiler[1]
			Manoeuvring	Hotelling	
Emission Factor (g/kwh)	NO_x	14	14.7		2.1
	SO_2	11.24	11.98		16.1
	RSP	1.43	1.44		1.47
	FSP	1.32	1.32		1.35
Emissions Rate[3] (kg/hr)	NO_x	24.64	174.56	139.65	2.10
	SO_2	19.78	142.26	113.81	16.10
	RSP	2.517	17.10	1 3.68	1.47
	FSP	2.323	15.68	12.54	1.35

1. Refer to Table 2-9 of USEPA ICF2009, EF for engine type of Medium-speed diesel (MSD) with the Residual Oil (RO) is adopted for main engine, and EF for ST with RO is adopted for boiler. Please noted that the RO with 2.7% Sulphur used in the mentioned above table.
2. Refer to Table 2-16 of USEPA ICF2009
3. Emission Rate = emission factor × engine power × load factor

9. The total emission rate of the cruise ships during manoeuvring and hotelling are summarized in **Table 3**.

Table 3 Total Emission per Hour for OGVs

Pollutants	Hourly Emission Rate (kg/hr)	
	Manoeuvring[1]	Hotelling[2]
NO_x	199.203	141.750
SO_2	162.045	129.910
RSP	19.617	15.150
FSP	17.998	13.890

1. The total emission from a manoeuvring cruise ship includes the emission from main engine and auxiliary engine
2. The total emission from a hotelling cruise ship includes the emission from auxiliary engine and boiler.

10. In the approved KTD EIA, the cruise ships have two modes in a 24 hour period in a day: berthing at the cruise terminal and hotelling at the cruise terminal. The berthing mode includes 15 minutes for manoeuvring motions of the cruise vessels from the navigation channel to near the cruise terminal, 15 minutes for final manoeuvring around the berth and 30 minutes for hotelling. In this assessment, the fuel with sulphur contents of 2.6% is adopted for the berthing mode while 0.5% is adopted for the hotelling mode. The emission parameters of the OGVs with berthing mode and hotelling mode are summarized in the **Table 4**:

Table 4 Total Emission from OGVs

Pollutants	Emission Rate (g/s)		
	Berthing Mode [1]		Hotelling Mode [2]
	Manoeuvring (15 mins per hour)	Hotelling (30 mins per hour)	Hotelling
NO_x	1.3834E+01	1.9688E+01	3.9375E+01
SO_2[3]	1.0836E+01	1.7375E+01	6.6826E+00
RSP[3]	1.3118E+00	2.0262E+00	7.7932E-01
FSP[3]	1.2036E+00	1.8577E+00	7.1451E-01

1. In an hour period of berthing mode, 15 minutes are manoeuvring motions of the cruise vessels from the navigation channel to near the cruise terminal; 15 minutes are final manoeuvring around the berth; and 30 minutes are hotelling at the cruise terminal. The emissions are weighted by ¼, ¼ and ½ for one hour, respectively.
2. Hotelling mode includes one hour hotelling operation in one hour period.
3. The emission factors of SO_2 and RSP are proportional to the Sulphur content in the fuel. The emission factor from Table 2-9 and Table 2-16 in USEPA ICF2009 is obtained from an engine burning residual oil with 2.7% Sulphur content. A correction factor of 0.963 (=2.6/2.7) is adopted for berthing mode (manoeuvring in 15 minutes and hotelling in 30 minutes) while 0.185 (=0.5/2.7) is adopted for hotelling mode.

11. As the fuel with higher sulphur content in the berthing mode, the emission impact due to cruise terminal during berthing mode is higher than berthing mode (see **Table 4**). Considering the worst case of cumulative air quality assessment, it is assumed that the two cruise ships would operate berthing mode sequentially in 17:00-19:00 and 19:00-21:00 which period is overlapped with the peak hour of traffic flow.

Tugboat

12. According to KTD EIA, two tugboats are used to assist the cruise ships during the 30 minutes berthing motion. The main emission pollutants are NO_2, RSP and SO_2. The emission factors are based on USEPA ICF2009. The emission factors and emission rates for tugboats are summarised in **Table 5**.

Table 5 Emission Information for Tugboats

Parameter		Main Engine	Auxiliary Engine
Engine Power[1] (kw)		1532	82
Load Factor[2]		31%	
Emission Factor[3] (g/kwh)	NO_x	13.2	
	SO_2	1.3	
	RSP	0.72	
Emissions Rate (kg/hr)	NO_x	6.269	0.336
	SO_2	0.617	0.033
	RSP	0.342	0.018

1. Refer to Appendix 6.4 in the approved KTD EIA
2. Refer to Table 3-4 of USEPA ICF2009
3. Refer to Table 3-8 of USEPA ICF2009

13. The total emissions rates for tugboats are listed in **Table 6**. The emission of SO_2 and RSP are proportional to the fuel sulphur content. According to Air Pollution Control (Marine Light Diesel) Regulation (Cap. 311Y), the tugboat in Hong Kong are required to use the fuels with sulphur content of not exceeding 0.05%. The emission factor listed in USEPA ICF2009 is considering a fuel with a sulphur content of 1.5%. Therefor the emission rate of RSP and SO_2 from the tugboat are corrected by a ratio of 0.05/1.5=0.033.

Table 6 Total Emissions for Tugboats

Pollutants	Total Emission Rate		
	Hourly (kg/hr)	15mins per hour (1.5% Sulphur) (g/s)	15mins per hour (0.05% Sulphur) (g/s)
NO_x	6.6045	4.5865E-01	4.5865E-01
SO_2[1]	0.6504	4.5170E-02	1.5057E-03
RSP[1]	0.3602	2.5017E-02	8.3390E-04
FSP[2]	0.3494	2.4266E-02	8.0888E-04

1. The emission factors of SO_2 and RSP are proportional to the Sulphur content in the fuel. The emission factor in Table 3-8 of USEPA ICF2009 is based on an engine burning residual oil with 1.5% Sulphur content. A correction factor of 0.333 (=0.05/1.5) is adopted.
2. Based on the Section 3.4.2 of USEPA ICF2009, FSP ($PM_{2.5}$) is assumed to be 97% of RSP (PM_{10}).

14. Following the assumptions in KTD EIA, the corresponding stack height, emission temperature, exhaust velocity and stack diameter of tugboat are 2 mPD, 537k, 24.6m/s and 0.2 m, respectively.

15. The locations of the emission sources for tugboats and OGVs are summarised in the **Table 7**.

Table 7 Emissions Parameters for ISCST Model

Emission Source ID	Emission Rate (g/s)		
	X	Y	Description
T1a	839940.3	818008.1	Tugboat 1 for OGV1 from the navigation channel to near the cruise terminal

H2	839683.2	818756.5	OVG2 hotelling (60mins)

Appendix 3.7

Calculation of Emissions from Typhoon Shelter

Emission in To Kwa Wan Typhoon Shelter

Auxiliary Engine during idling:

Population	=	60	
Engine Power(kW)	=	82	kW
Load Factor [1] (%)	=	43	%
Activity time (hr)	=	1	hr
Total area of To Kwa Wan Typhoon Shelter (m^2)	=	233200	m^2
Sulphur Content Correction Factor [3]	=	0.033	

	Emission Factor [2]	Corrected Emission Factor [4]	Emission Rate per barge	Total Emission Rate	
	g/kWh/barge	g/kWh/barge	g/hr/barge	g/s	$g/s/m^2$
NO_x	10	10.00	352.6	5.88	2.52E-05
SO_2	1.3	0.04	1.53	0.03	1.09E-07
RSP	0.4	0.01	0.47	0.01	3.36E-08
FSP[5]	0.388	0.01	0.46	0.01	3.26E-08

Notes

(1) Table 3-4 of Current Methodologies in Preparing Mobile Source Port-Related Emission Inventories, ICF (2009)

(2) Table 3-8 of Current Methodologies in Preparing Mobile Source Port-Related Emission Inventories, ICF (2009)

(3) According to "Air Pollution Control (Marine Light Diesel) Regulation" (Cap. 311Y) requires the fuels to be with sulphur content not exceeding 0.05%. The sulphur content (1.5%) is used in Table 3-8 Current Methodologies in Preparing Mobile Source Port-Related Emission Inventories, ICF (2009). Therefore, the sulphur content correction factor is 0.05/1.5 = 0.033.

(4) Multiplied by sulphur content correction factor for SO_2, RSP (PM_{10}) and FSP ($PM_{2.5}$).

(5) According to ICF (2009), FSP should be estimated based on 97% of RSP.

Appendix 3.8

Detailed Assessment Results of Construction Phase

1st Hourly Maximum TSP Concentration - Mitigated Scenario

Note: *For conservative assessment, the predicted cumulative 4th highest 10-minute SO_2 concentrations presented were calculated from the predicted cumulative maximum hourly SO_2 concentrations based on the stability-dependent multiplicative factors. According to this conversion method, the predicted cumulative 4th highest 10-minute SO_2 concentration is equal to the predicted cumulative maximum 10-minute SO_2 concentration.*

Appendix 3.10

Estimated Communities within the Exceedance Zone of Annual NO_2

Introduction

1. To estimate the likely size of the affected communities within the exceedance zone of annual NO_2, a survey has been conducted in April 2016.

2. The exceedance zones of annual NO_2 cover playgrounds, schools, shops and residential areas as mentioned in Table 3-13 and Table 3-17 of the main text. The exposure to NO_2 for the users of playgrounds, the students in the schools and the staff in the shops or restaurants should be limited as they will not stay continuously for 24 hours a day and 365 days a year. Hence, the actual exposure to the NO_2 shall be less than predicted. Therefore, only the number of units (shops or school), but not the population, are presented in this appendix for reference purpose. The residential regions are considered to have a long term NO_2 exposure and thus the estimation of the likely size of the affected communities within the exceedance zone of annual NO_2 is based only on the number of dwellings.

3. The likely size of affected communities within the exceedance zones of annual NO_2 would be the highest in the worst assessment year (2023) based on the Figure 3-6K to Figure 3-6P.

Assumptions

4. A number of assumptions were made in the community survey and listed as follows:

   - No change in the number of shops and residential flats over the assessment years (from Year 2016 to Year 2023);
   - Each flat consists of 1 dwelling only (no unauthorized partitioned unit is considered);
   - Based on "Population Census" issued by Census and Statistics Department for To Kwa Wan and Kowloon City districts in 2011, the average number of occupant per unit, 2.88, was adopted to calculate the affected population within the exceedance zones. Details can be found in Table 3; and
   - The growth of population within the study area was disregarded.

Results

5. The numbers of affected shops and schools/kindergartens reduced gradually from Year 2023 to Year 2036 as shown in **Table 1**.

Table 1 Numbers of Affected Shops and Schools/Kindergartens

Year	Shops	Schools/Kindergartens
2023	815	10
2026	795	10
2036	71	2

[I] The number of staff in the shops depends on the types of use of the shops and therefore it is subject to variation. Moreover, the staff in the shops have limited of exposure to NO_2. Therefore, only the number of shops or schools are presented.

6. The study area of the Project (i.e. 500m from the Project boundary) overlaps with 5 census zones and part of the Kai Tak Development Area as shown below.

- Census Zone 2.8.5 (Zone A),
- Census Zone 2.4.6 (Zone B),
- Census Zone 2.4.1 (Zone C),
- Census Zone 2.4.2 (Zone D),
- Kai Tak Development Area (Census Zones 2.4.7 and 2.8.6) (Zone E), and
- Census Zone 2.8.3 (Zone F) (No dwellings within the study area).

The locations of the census zones and study area are shown in **Figure 1**.

7. The population covered in the study area are summarized in **Table 2a** and **Table 2b**. Since the study area do not cover any dwellings in Zone F, Zone F was excluded from the calculation.

Table 2a Estimated Population within the Study Area (Census Zones)

Zone ID	Census Zone ID	Total Population[I]	Residential Dwellings [I]	Area Ratio of Study Area	Estimated Population in Study Area [II]
A	2.8.5	16,270	5,942	13%	2,065
B	2.4.6	17,252	5,538	19%	3,296
C	2.4.1	46,939	16,542	18%	8,607
D	2.4.2	51,030	17,662	45%	23,176
Total (Zones A - D)		131,491	45,684	-	37,144

[I] The total population and number of residential dwelling for Zones A-D are referred to "Population Census" issued by Census and Statistics Department in 2011.

[II] The population in the study area is calculated by the total population and the area ratio of the study area.

Table 2b Estimated Population within the Study Area (Total)

Zone ID	Census Zone ID	Total Population	Residential Dwellings	Area Ratio of Study Area	Estimated Population in Study Area
Total (Zones A - D)		-	-	-	37,144
E	Kai Tak Development Area	118,009[II]	41,000 [I]	70%	82,606 [III]
Total (Zones A - E)		-	-		~120,000

[I] The number of dwelling of Zone E is based on the information of Development Bureau for the Kai Tai Development Areas (30th Sep 2015).

[II] The total population of Zone E is calculated by 41,000 dwellings times 2.88 person per unit, which is calculated by the total population and dwelling numbers of Zone A - D (2.88 = 131,491/45,684).

[III] The population in the study area is calculated by the total population and the area ratio of the study area.

8. The percentages of affected population to the total population in Years 2023, 2026 and 2036 are summarized in the **Table 3**.

Table 3 Percentages of Affected Population

Year	Affected Dwellings[I]	Affected Population[II] / Total Population	Percentage of Affected Population [III]
2023	1,074	3,078 / 120,000	2.6%
2026	830	2,379 / 120,000	2.0%
2036	45	129 / 120,000	0.1%

[I] The number of affected dwellings are based on survey finding.

[II] The affected population are calculated by affected dwelling multiply by 2.88 persons per unit.

[III] The percentage of affected population is calculated by dividing the affected population by the total population (120,000) in the study area.

9. Details of the shops and dwellings within the exceedance zones in Years 2023, 2026 and 2036 are shown in **Table 4** to **Table 9**.

10. Photo records of the affected areas are included in **Annex I**.
