Calculation of dust removal efficiency with different watering interval time

The removal efficiency is estimated based on USEPA Control of Open Fugitive Dust Sources (EPA-450/3-88-008)

By $C = 100 - (0.8*p*d*t)/i$

where
- C — average control efficiency, in percent
- p — potential average hourly daytime evaporation rate, in mm/h
- d — average hourly daytime traffic rate in vehicles per hour
- i — application intensity in litre/m^2
- t — time between applications in h

Obtained from Hong Kong Observatory website, the total annual evaporation recorded in Hong Kong averaged from 1981-2010 is 1227.3 mm (35.92 inches).
http://www.weather.gov.hk/cis/normal/1981_2010/normals_e.htm

p	0.233500589	mm/h	(0.0065*annual evaporation in inches)
d	21	per hour	Peak hourly daytime traffic is used for conservative approach
i	0.473	litre/m^2	Minimum application intensity and that requirement would be stated in the tender document

Time Between Applications (h)	Average Control Efficiency (%)
6	50.2
3	75.1
1	91.7

Assumptions of EMFAC-HK

Estimation of Vehicular Emission for the Study Area by EMFAC-HK

Introduction

In accordance with the EIA Study Brief (ESB-274/2014), the air pollution impacts of future should be assessed based on the highest emission strength from the road within the next 15 years upon commissioning of the Project. The selected year of assessment shall represent the highest emission scenario given the combination of vehicular emission factors and traffic flow for the selected year.

A motor vehicle emission model, EMFAC-HK, was employed to determine the vehicular emission factors. Assumptions and traffic flow data used in the model are presented in the followings.

Version of EMFAC-HK

During the course of undertaking the air quality assessment, the latest version EMFAC – HK V2.6 which was issued by EPD on 2 Feb 2014 was adopted to compile the traffic emission inventory for different scenarios and hence to determine the highest emission scenario.

Scenarios

Under the current schedule, the Project is proposed to be completed by the end of Year 2020. Year 2021 is therefore adopted as the commissioning year. Since the air pollution impacts of future road traffic should be calculated based on the highest emission strength within the next 15 years upon operation of the Project, four representative years – 2021, 2023, 2026 and 2036 were chosen to be the scenario years for sensitivity test. It should be noticed that the eastern part of Central Kowloon Route (CKR) works will still be under construction in 2021, therefore 2021 is assumed to be without CKR.

Model Years

The calculation of EMFAC-HK includes vehicle model for 45 years. The starting model year is 45 years prior to the assessment year. As mentioned, the sensitivity test will cover three calendar years which are 2021, 2023, 2026 and 2036. The start and end of model year for these three years are shown in **Table 1**.

Table 1 Starting and ending model year for calendar Years 2021, 2023 2026 and 2036

Calendar Year	Starting Model Year	Ending Model Year
2021	1976	2021
2023	1978	2023
2026	1981	2026
2036	1991	2036

Road Grouping

Annex I showed the road networks within the Study Area covered in EMFAC-HK model and all the road networks are categorized into 4 road types. With reference to the road design, the design speed limits of all road links within the Study Area included 50kph, 70kph and 80kph. According to the Traffic Consultant, only road networks with speed limit of 50kph have cold starts. Therefore, the road with speed limit of 50kph was split to two classes which are with and without cold starts. The road types which have been taken in account in this Project are summarized in **Table 2**. The concern roads for each road type are summarized in **Table 3**.

Modelling Mode

As suggested in EPD guideline, "Burden mode" which can provide hourly vehicular emissions according to the diurnal variations of traffic flow, temperature, relative humidity and speed, was selected for the Project.

Speed Profile

The speed profiles are inputted to EMFAC-HK by 24 hours and vehicle classes for each road type based on the data provided by Traffic Consultant. In accordance with the Road Traffic Ordinance, for any road with design speed limit of 70kph or above, the maximum speed limit for medium goods vehicles, heavy goods vehicles and buses shall be limited to 70kph. Therefore, speed limit of 70km/hr was applied for heavy good vehicles > 15t (Vehicle Class No.08), non-franchised bus (No. 15, 16) and franchised bus (No. 17, 18). For public light bus (No. 11) and private light bus (No. 12, 13), speed limit of 80km/hr has been applied. The speed profiles for different road types of 2021, 2023, 2026 and 2036 are provided in **Annex II**.

Vehicle Population

The vehicle population data (in Year 2010) published by EPD have been used for future assessment years in the EMFAC-HK modeling. The Year 2010 HK licensed vehicle population data are made reference to the EPD's website (http://www.epd.gov.hk/epd/english/environmentinhk/air/guide_ref/emfac.html). The default vehicle populations forecast in EMFAC-HK shall be used for this Project.

Temperature & Relative Humidity

Hourly temperature and relative humidity were obtained from the meteorological data of MM5 Model from EPD. Since the Study Area covered four grids of MM5 Model, which are (30, 29), (31, 29), (30, 28) and (31, 28), the meteorological data from these four grids are adopted and averaged together for each of 24 hours. The temperature in

MM5 Model was converted from Kelvin to Degree Celsius before inputting to EMFAC-HK. The results of 24-hour temperature and relative humidity are shown in **Table 4**.

Vehicle Emission Standard Implementation Programme and Technology Fraction

The requirements of the Air Pollution Control (Vehicle Design Standards) (Emission) Regulations must be complied for all first registration motor vehicles in Hong Kong. Therefore, it is considered applicable for this assessment.

The latest updated implementation programme of the vehicle emission standards in Hong Kong is adopted in this assessment based on the available data in EPD's website (March 2013). The exhaust technology fractions have been made reference to the latest 2010 licensed vehicle by age and technology group fractions for different vehicle classes as provided in EPD's web site (http://www.epd.gov.hk/epd/english/environmentinhk/air/guide_ref/emfac.html). The latest implementation programme and technology fractions adopted in the EMFAC-HK are also provided in **Annex III**.

Vehicle Accrual

The default "Vehicle Accrual" in EMFAC-HK has been adopted for the assessment.

Vehicle Kilometre Travelled (VKT)

VKT is calculated by multiplying the number of vehicles for each of the 16 vehicle types by the length of road travelled in the Study Area for each road type. The hourly traffic flows for the 16 vehicle type for different road type were provided by the Traffic Consultant. The VKT of each links for 2021, 2023, 2026 and 2036 is listed in **Annex IV**. The traffic flow forecast and speed fraction for all scenario years with 16 vehicle classes have been submitted to the Transport Department (TD) for agreement with the methodology of traffic forecast. The approval on traffic data from TD is attached in **Annex VII**.

Trips

Trip in EMFAC-HK is referred to the number of cold start trip on a day. Since there is no information on specific difference between the local road in the Study Area and the local road within HKSAR, it is proposed to estimate the number of trips within the study area by assuming that the local trip is proportional to the territorial trip with a constant of proportionality of ratio of the local VKT and the territorial VKT. Adjusting trips in EMFAC-HK can be achieved by multiplying the constant of proportionality to either vehicle population or trips. The latter is chosen in this assessment. The adjusted trips for each scenario years are shown in **Annex V**. Since no cold start at the middle of roads other than road type 1, this scaling method has been only adopted for road type 1.

Vehicular Emission Factor

EMFAC-HK outputs the hourly vehicular emission (in tonne) in the combinations of 24 hours and 16 vehicular classes for each road category. To obtain the emission rate (in grams/VKT), the hourly emissions are then divided by the vehicle kilometer travelled (VKT).

The calculated hourly vehicular emission factors in gram per mile per vehicle are then selected for incorporation into the air dispersion model. The calculated vehicle emission factors together with the hourly forecasted traffic flow are used to calculate the emissions of the road links within the study area and the 24 hour emission for model input in this Project. The fleet averaged emission factor and traffic flow of each links are given in Appendix 2.

Determination of Worst Assessment Year

According to "2010 Hong Kong Emission Inventory Report" published by EPD, tailpipe emission is the largest source of NOx emission besides navigation. Hence, NOx will be identified as the key pollutant in determination of the highest emission strength

of scenario years. The results turned out that the most significant emission occurs at 2023 due to the current fact that CKR will be commissioned in 2023 and vehicle population has a pronounced rise throughout the time. A daily traffic trend from 2021 to 2036 is summarized in **Annex VI**. The total emission of NOx in gram per day for different road types with corresponding VKT is shown in **Table 5**.

Different Scenarios

In order to analysis the induced traffic emission impact from the Project, three scenarios of traffic data are also run by EMFAC: 1) "Without Project"; 2) "With Project Only"; and 3) "With Project and Event".

"**Without Project**" consider the existing traffic in the four assessment years only but not the project related traffic.

"**With Project only**" consider the overall traffic including existing traffic and the induced traffic from the project without event operation. The induced traffic in this scenario are mainly from the employee of the project and the tourists in the hotel travelling to and from the project area.

"**With Project and Event**" consider the overall traffic including existing traffic and the induced traffic from the project with event operation (e.g. sports events and concerts). Comparing "With Event" and "With Project only", extra traffic is induced by the spectators/audience travelling to and from the Project Area during the course of events such as sport events and concerts. The extra traffic appears in Hours 1800-2000 and Hours 2200-2400. The Speed Fraction, VKT, and Trip of the three scenarios are also included in the **Annex II**, **Annex IV** and **Annex V**.

It should be noted that 60 major events was assumed to be held at the Main Stadium of the MPSC per year. A scenario, called as "**With Project and 60 Days Full Event**", was calculated for annual averaged NO_2. The NOx Emission and number of vehicles for different scenario in 2023 was summarised in **Table 6**. The NO_2 concentration for "**With Project and 60 Days Full Event**" was calculated from NOx by Ozone limiting method and NOx for "**With Project and 60 Days Full Event**" was weighed average from "**With Project and Event**"* and "**With Project only**":

$$NOx_{With\ Project\ and\ 60\ days\ Full\ Event} = \frac{60 \times NOx_{\text{With Project and Event}} + 305 \times NOx_{\text{With Project Only}}}{365}$$

*To facilitate the modeling setup and runs, "**With Project and Full Event**", i.e., with 365 days full events, was assumed for assessing other pollutants emissions.

* For diesel passenger cars,
HK adopted California Tier I Standards in April 1998.
HK adopted California LEV 1Standards in January 2001.
HK adopted California LEV 2 Standards in January 2006
HK adopted California LEV 2 Standards or Euro V Standard for passenger car with positive ignition engine in June 2012
California LEV 3 Standards or Euro VI Standard for passenger car with positive ignition engine tentatively in Jan 2016

NA = Not applicable

Note *: While Hong Kong adopts EU's emission standards and implementation timetable, US or Japan standards of similar stringency are accepted as equivalent standards where*

#1 For ULP Private Cars registered on or after 1 January 1992 are equipped with catalytic converters.

#2 Petrol private cars are divided into two categories (max. mass<=2.5t and max. mass >2.5t) with different implementation dates and different emission requirements. However, very few private cars are under the category of max. mass >2.5 t.

#3 Different implementation dates for Euro III and IV goods vehicles with GVW <=1.7 tonne but the total number for goods vehicles <= 1.7tonne is very small (25 for petrol as of end 2010)

#4 Different implementation dates for Euro II diesel goods vehicles and buses with GVW of 3.5-4 tonne but the total number of diesel goods vehicles and buses in this range is very small (16 as of end 2010)

#5 Different implementation dates for Euro III & IV light buses with GVW <=1.7 tonne and petrol pre-Euro light buses 1.7-2.5t, but no light buses of that weight as of end 2010.

#6 All new taxis supplied to the local market are Euro I models from 1 January 1996.

#7 The implementation dates for Euro VI emission standards are for the purpose of assessment only.

#8 All new motorcycle models are required to comply with Euro III emission standards on this date. From 1 January 2009, all motorcycles are required to meet Euro III emission standards.
