9. List of Wild Plants under State Protection (promulgated by State Forestry Administration and Ministry of Agriculture on 4 August, 1999).

*The following species are not considered species of conservation importance because of the following reasons:

- *Bauhinia corymbosa* and *Solanum capsicoides* were considered very rare and rare respectively by Corlett *et al.* (2000). However, these species are known to be introduced to Hong Kong and are therefore not regarded as species of conservation importance.
- *Diplacrum caricinum* had been considered restricted in the in the Biodiversity Survey of Hong Kong (Corlett *et al.* 2000) but was regarded as rare in the territory-scale floristic survey of marshes in Hong Kong by Yip *et al.* (2010). In the light that this species was only considered rare in marshy habitats in Hong Kong defined in the latter publication by AFCD (2010) and that it could be found in a wide range of habitats, such as wetland (Corlett *et al.* 2000), marsh (Corlett *et al.* 2000), farmlands (Hong Kong Herbarium and South China Botanical Garden 2011) and wastelands (Hong Kong Herbarium and South China Botanical Garden 2011). Therefore, *Diplacrum caricinum* is not treated as a species of conservation importance.
