Appendix 3.2 Calculation of Construction Dust Emission Source

Calculation of Dust Suppression Efficiency from Watering

Dust suppression efficiency is assumed to be 91.7%. Assumptions are stated as below.

With reference to the Equation (5-4) of USEPA's Control of Open Fugitive Dust Sources (EPA-450/3-98-008), dust suppression efficiency can be estimated by:

$$C = 100 - \frac{0.8 \cdot p \cdot d \cdot t}{i}$$

where

C = average control efficiency, in percent

p = potential average hourly daytime evaporation rate in mm/hour

d = average hourly daytime traffic rate in vehicles per hour

i = application intensity in L/m²

t = time between applications in hour

The following assumptions are made for assessment purpose:

Assumption 1:

Potential average hourly daytime evaporation rate p can be estimated by $0.0049 \cdot e$, where e is the mean annual average evaporation rate (inches). From past measurement data in Hong Kong's Observatory, evaporation recorded at King's Park between 1992 - 2021 is 1205.1 mm¹. Therefore $p = 0.0049 \cdot (1205.1 \text{ mm}) = 0.0049 \cdot (47.442939 \text{ inches}) = 0.2325$.

Assumption 2:

Estimate average hourly daytime traffic rate in vehicles per hour = 20. ($d = 20$)²

Assumption 3:

Assume watering application intensity as 0.90 L/m². ($i = 0.90$)

Assumption 4:

Assumes watering frequency as once every 2 hours. ($t = 2$)

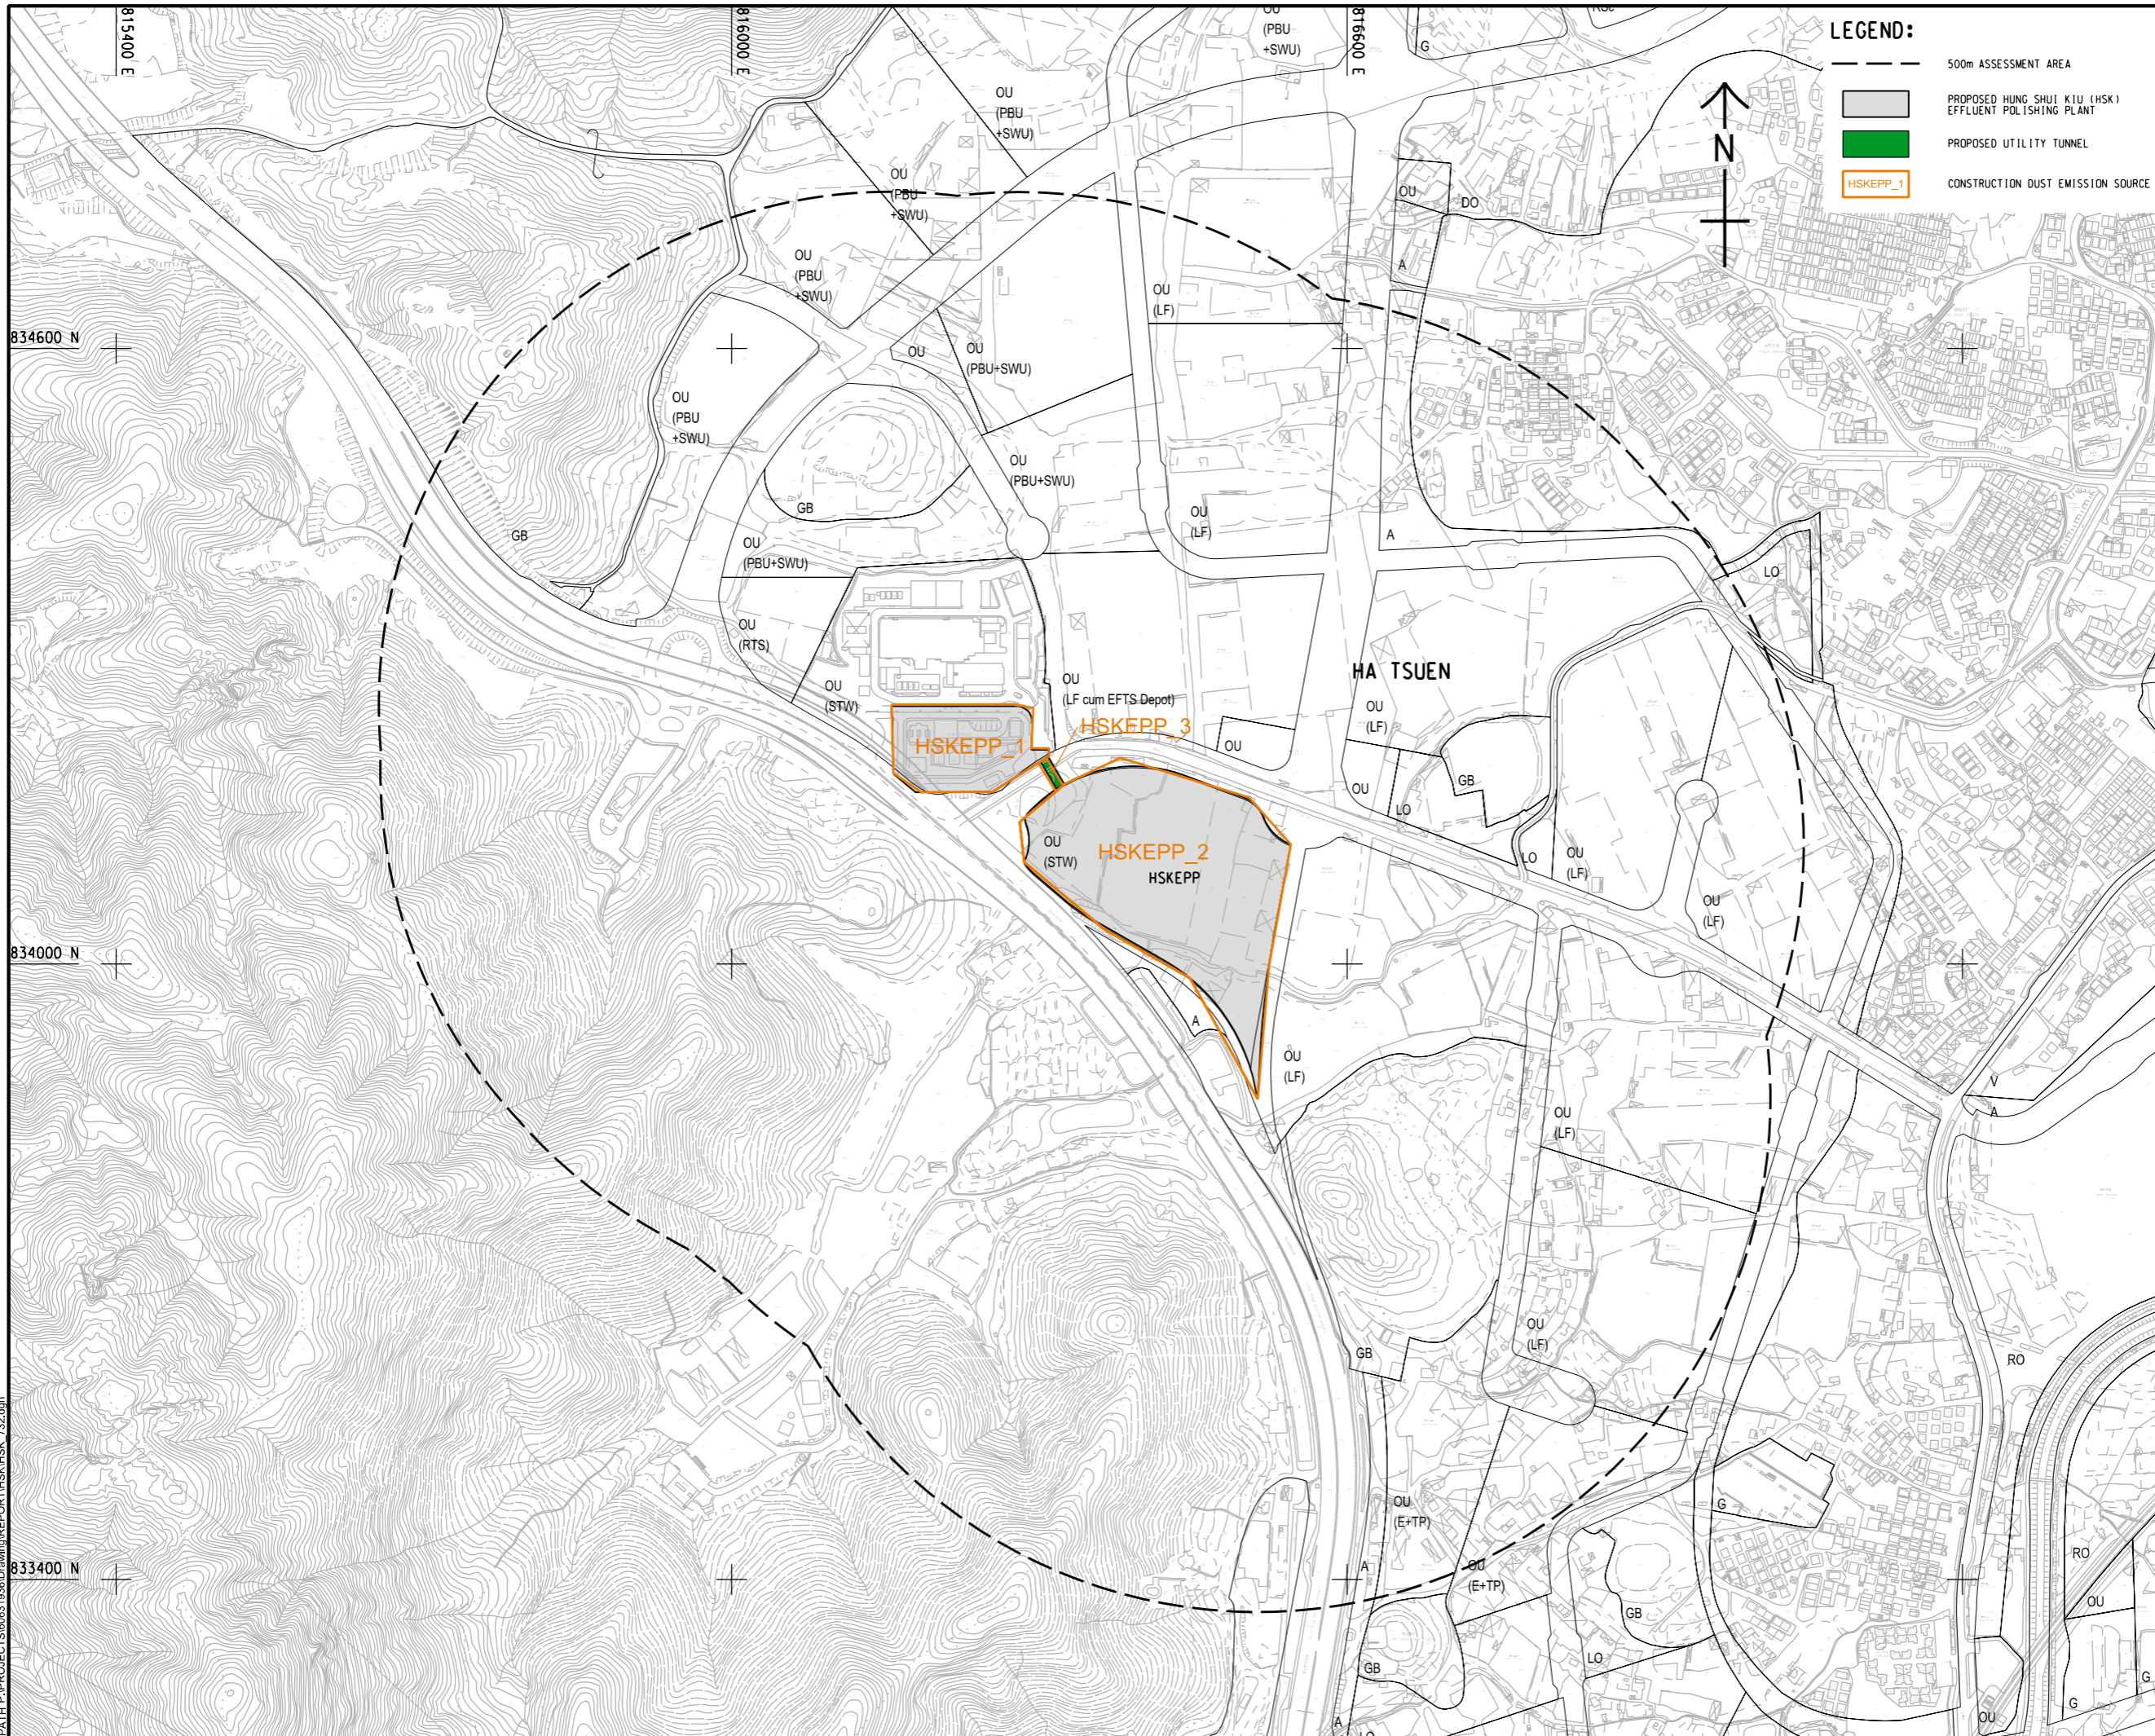

With the above assumptions, dust suppression efficiency is calculated as below:

$$C = 100 - 0.8 \cdot (0.2325) \cdot (20) \cdot (2) / 0.90 = \mathbf{91.7\%}$$

¹ The Hong Kong's Observatory evaporation recorded at King's Park between 1992 to 2021 is taken from <https://www.hko.gov.hk/en/cis/monthlyElement.htm?ele=EVAPO>

² The average hourly daytime traffic rate in vehicles per hour is provided by the Engineer.
