

**Comparison of Odour Impact between
Existing (Without Project) and Future (with Project) Scenarios**

1. BACKGROUND

- 1.1.1 San Tin / Lok Ma Chau Development Node (STLMC DN, The Project) is proposed in the area located to the west of Kwu Tung North and Fanling North New Development Areas (NDAs) and Fanling and Sheung Shui New Towns, and to the northeast of Yuen Long and Tin Shui Wai New Towns. Refer to **Appendix A** for the location of the Project area. There are nine existing livestock farms within STLMC DN, including two chicken farms and seven pig farms located at the southern portion of the Project area. These existing livestock farms would be removed under the Project. With the removal of these livestock farms and their odorous sources, it is anticipated the overall odour emission in the area would be improved.
- 1.1.2 Despite these existing livestock farms within the Project area to be removed, an existing livestock farm (Retained Livestock Farm) located in the vicinity of north boundary of the Project area and the Sewage Treatment Works of San Tin Barracks (STBSTW) fall within 500m from Project boundary. These facilities would still pose potential odour impact on the existing air sensitive receivers (ASRs) and planned ASRs under STLMC DN. Also, some infrastructural works under STLMC DN, namely Effluent Polishing Plant (STLMC EPP), Food Waste Pre-treatment Facility (FWPF), Refuse Transfer Station (RTS) and three Sewage Pumping Stations (SPSs), would pose potential odour impact on the existing and planned ASRs.
- 1.1.3 The identified potential odour sources under the Existing Scenario (Without Project) and Future Scenario (With Project) are summarized in **Table 1.1**. The odour emission inventories for both scenarios were also established. The emission data for livestock farms were estimated based on the findings of the odour surveys undertaken under *Study on Phase One of Development of New Territories North – San Tin / Lok Ma Chau Development Node - Feasibility Study*. The odour emission from odorous infrastructural works under STLMC DN were calculated based on the engineering design of the Project and made reference to odour emission data of similar scale of these facilities of past projects. The detailed calculation of the emission inventories for Existing Scenario and Future Scenario are presented in **Appendix A** and **Appendix B** respectively. The overall odour emission in the area would be reduced by around 84% from the Existing Scenario (Without Project) to Future Scenario (With Project).

Table 1.1 Odour Emission Sources in Existing and Future Scenario

Odour Emission Source	Existing Scenario (Without Project)	Future Scenario (With Project)
Existing Pig Farms (Pig Farm 2 – 4, 7 – 8, and 10 – 11)	O	X
Existing Chicken Farm 5, 9 ^[2]	O	X
Existing Chicken Farm 6 ^[1]	O	O
Retained Livestock Farm (Pig Farm 1)	O	O
STBSTW	O	O
STLMC EPP	X	O
Proposed FWPF	X	O
Proposed RTS	X	O
Proposed SPSs	X	O

Remark:

[1] Chicken Farm 6 falls outside 500m assessment area of STLMC DN. It is excluded from the emission inventory.

[2] Chicken Farm 9 is lack of on-site odour survey data and the data collected from odour sampling in Chicken Farm 5 were not applicable. It is therefore excluded from the emission inventory.

1.1.4 However, the model prediction showed that the cumulative odour concentrations would exceed the EIAO-TM criterion of 5 OU/m³ at existing representative ASRs A26 (1.5, 5, 10 mAG) and A33 (1.5, 5, 10, 15 mAG), as shown in **Table 1.2**. Exceedance of odour impact was also predicted at development sites with potential air sensitive use, including Site G.5.8, G.5.9, G.5.10, G.5.11, G.5.12, E.5.1 and E.5.2 at 1.5mAG, 5mAG, 10mAG and 15mAG in vicinity of the existing San Tin Barracks STW, and Site OU(I&T)3.1.8 at 1.5 mAG, 5 mAG, 10 mAG and 15 mAG in the vicinity of Retained Pig Farm. A further study (This Study) is therefore carried out to investigate the change in cumulative odour impact between Existing and Future Scenarios, and confirm such improvement brought by the Project at the ASRs and areas with exceedance.

Table 1.2 Predicted Cumulative Odour Concentrations at A26 and A33

ASR ID	Assessment Height (mAG)	Maximum 5-second Average Odour Concentration (OU/m ³) (EIAO-TM: 5 OU/m ³)
A26	1.5	13.94
A26	5	13.39
A26	10	12.23
A33	1.5	12.59
A33	5	11.28
A33	10	10.97
A33	15	5.11

2. ASSESSMENT METHODOLOGY

- 2.1.1 The odour emission inventories of Retained Livestock Farm, STBSTW, STMLC EPP, FWPF, RTS and 3 SPSs are presented in **Appendix A** and **B**, while their modelling approach adopted is presented in **Appendix C**.
- 2.1.2 Each of the 7 Existing Pig Farms (Pig Farm No. 2 – 4, 7 – 8, and 10 - 11) was modelled as area source because pig farm is commonly found open-air design. Given that the concerned ASRs are far away from each existing pig farm not to be retained (more than 500m), odour sources in a pig farm were modelled by adopting a single area source over the livestock farm boundary. The livestock farm boundary refers to the farm layout plan obtained from AFCD. The details of these odour emission sources are presented in **Appendix A**.
- 2.1.3 Farm 5 was the only existing chicken farm considered in the assessment because an on-site odour survey has been conducted to determine its odour emission rates. Their odour emission inventories were presented in **Appendix A**. According to the odour survey, chicken house was equipped with mechanical ventilation fans, thus each house was modelled as horizontal point source individually. Other supporting facilities such as sewage treatment, conveyor belts and rubbish bin area, were modelled as one area source. All emission sources were modelled at the **furthest south-east corner** of the farm for the purpose of broad-brush assessment, as illustrated in **Appendix A**. The details of these odour emission sources are also presented in the appendix.
- 2.1.4 Existing chicken Farm 6 falls outside 500m assessment area of the Project, thus it is excluded from the calculation. Chicken Farm 9 is within 500m assessment area, however it is lack of on-site odour survey data and the data collected from odour sampling in Farm 5 is not applicable, thus it is also excluded from the calculation. Such approach results in less odour emission in total considered in Existing Scenario. When comparing the odour impact in the two scenarios, e.g. $OU_{Future} - OU_{Existing}$, a decrease in future odour impact would be diminished in magnitude. Nevertheless, as far as environmental benefit is concerned, e.g. a decrease in odour impact, the approach is on conservative side and is acceptable for the purpose of comparison.

3. CHANGE IN CUMULATIVE ODOUR IMPACT

- 3.1.1 The cumulative odour concentrations at concerned representative ASRs A26 and A33 in the Existing Scenario and Future Scenario were predicted respectively. Comparison of odour impact between the Existing and Future Scenarios are presented in **Table 3.1**. The comparison showed that the cumulative odour concentration at A26 and A33 would be lower under the “Future Scenario”. The implementation of the Project is expected to bring environmental benefit, in particular improving the existing odour impact where exceedance of cumulative odour impact were predicted. No adverse residual odour impact is thus anticipated during the operation phase of the Project.

Table 3.1 Comparison of Odour Impact between Existing and Future Scenarios

ASR ID	Height (mAG)	5-second Average Odour Concentration (OU/m ³)		Change
		Future Scenario	Existing Scenario	
A26	1.5	13.94	15.47	-1.53
A26	5	13.39	14.92	-1.53
A26	10	12.23	14.04	-1.80
A26	15	4.74	6.68	-1.94
A33	1.5	12.59	12.68	-0.09
A33	5	11.28	11.41	-0.14
A33	10	10.97	11.04	-0.07
A33	15	5.11	5.14	-0.03

Remark:

Bold value indicates exceedance in odour criterion of 5 OU/m³ stipulated in EIAO-TM.

- 3.1.2 The change in spatial odour concentration within the exceedance areas were further evaluated. Contours of change in odour impact in 10m x 10m resolution at 1.5mAG, 5mAG, 10mAG, 15mAG and 20mAG are presented in **Appendix D**. The spatial comparison results showed that the cumulative odour impact would generally decrease within the exceedance area with the implementation of the Project. The increase of odour concentration was predicted in the northeast and northwest of the Retained Pig Farm at 10mAG and 15mAG. A temporary shelter is found in the area, however it is less than 5 metres tall and is used for the purpose of parking / storage. An increase of odour concentration was also predicted at 10mAG at the open ground within San Tin Barracks. In summary, no existing and future air sensitive uses, including openable window / fresh air intakes of the ventilation system or recreational uses in open space, within the exceedance zone would suffer from the increase of odour impact. It is further confirmed that no adverse residual odour impact is anticipated during the operation phase of the Project.

Appendix A

Odour Emission Inventory of Existing Scenario

Appendix A Odour Emission Inventory of Existing Scenario

Comparison of Odour Emission Inventory (Existing vs. Future Scenarios)

Facility	Farm No. ^[1]	Odour Emission Rate (OU/s)	
		Existing Scenario	Future Scenario
Pig Farm 1 (Retained Pig Farm)	LK871	7982	7982
Pig Farm 2	LK726	6560	0
Pig Farm 3	LK718	9653	0
Pig Farm 4	LK840	12086	0
Chicken Farm 5	LK1172	28558	0
Chicken Farm 6 ^[3]	LK934	-	-
Pig Farm 7	LK799	3857	0
Pig Farm 8	LK806	8777	0
Chicken Farm 9 ^[3]	LK1090	-	-
Pig Farm 10	LK809	7148	0
Pig Farm 11	LK801	7018	0
San Tin Barracks Sewage Treatment Works (STBSTW)	-	3627	3627
STLMC Effluent Polishing Plant (EPP)	-	0	1266
Proposed Food Waste Pre-treatment Facility (FWPF)	-	0	1577
Proposed Refuse Transfer Station (RTS)	-	0	888
Proposed Sewage Pumping Station (SPSs)	-	0	300
Total		95265	15640
Percentage Change		-	-84%

Remarks:

[1] Odour emission rate calculated for each pig farm and chicken farm are based on the information from Agreement No. CE 28/2019 (CE) Study on Phase One Development of New Territories North - San Tin/ Lok Ma Chau Development Node - Feasibility Study - Working Paper on Odour Emission Inventory for Livestock Farms (17 December 2021).

[2] Odour emission rate calculated for STBSTW, EPP, FWPF, RTS and SPSs are based on the information from Agreement No. CE20/2021 (CE) First Phase Development of New Territories North - San Tin / Lok Ma Chau Development Node - Investigation.

[3] Chicken Farm 6 falls outside the 500m assessment area of STLMC DN. Chicken farm 9 is lack of on-site data and the data collected from odour sampling in Chicken Farm 5 is not applicable.

Both Farm 6 and 9 were therefore omitted. This is considered as a conservative approach to demonstrate reduction in odour emission due to the Project.

Remarks:

[1] SOER refers to Working Paper on Odour Sampling Results and Odour Emission Inventory – Pig Farm LK801 (Revision 2) dated 31 January 2022 which has been approved by EPD.

[2] Average value of 2.89 OU/m²-s is adopted for the overall SOER of a pig house, which is based on two SOERs (1.86 OU/m²-s and 3.91 OU/m²-s) determined in the reference odour survey.

[3] Dimension of the odour sources referenced to the farm layout plan provided by AFCD.

[4] PFA-PFO are area sources and hence their emission rates are presented as OU/m²/s.

[5] It is a stand-alone machine identified from the farm layout plan. 1 m² is assumed for the purpose of calculation.

[6] The facility was not identified odorous in the odour sampling for Pig Farm 18/19/P43. SOER of anaerobic digestion tank is adopted for assessment purpose to avoid underestimation of odour impact.

Remarks:

[1] SOER refers to Working Paper on Odour Sampling Results and Odour Emission Inventory – Pig Farm LK801 (Revision 2) dated 31 January 2022 which has been approved by EPD.

[2] Average value of 2.89 OU/m²-s is adopted for the overall SOER of a pig house, which is based on two SOERs (1.86 OU/m²-s and 3.91 OU/m²-s) determined in the reference odour survey. It is the same SOER adopted for the pig houses of Retained Pig Farm

[3] Dimension of the odour sources referenced to the farm layout plan provided by AFCD.

[4] Refer to layout plant by AFCD for Farm 3, there is collection tank to store waste before treatment but no sludge holding tank. It is anticipated that waste storage area is to store waste after treatment, thus the SOER of sludge storage tank is adopted for waste storage area.

[5] Collection tank and retention tank are the facilities before primary treatment and secondary treatment. The waste contents in these facilities are assumed to be similar, thus the SOER of collection tank is adopted for retention tank.

[6] Coagulation and sedimentation usually work together to remove suspended solids from the wastes. The waste contents in both tanks are assumed to be similar, thus the SOER of sedimentation tank is adopted for coagulation tank.

Appendix A Odour Emission Inventory of Existing Scenario

Farm 4 (Existing Pig Farm)

Farm ID LK840

		Total Area	218.93	Sub-Total	2912.96		
				Total Odour Emission	12085.62		

Remarks:

[1] SOER refers to Working Paper on Odour Sampling Results and Odour Emission Inventory – Pig Farm LK801 (Revision 2) dated 31 January 2022 which has been approved by EPD.

[2] Average value of 2.89 OU/m²-s is adopted for the overall SOER of a pig house, which is based on two SOERs (1.86 OU/m²-s and 3.91 OU/m²-s) determined in the reference odour survey. It is the same SOER adopted for the pig houses of Retained Pig Farm

[3] Dimension of the odour sources referenced to the farm layout plan provided by AFCD.

[4] Collection tank and retention tank are the facilities before primary treatment and secondary treatment. The waste contents in these facilities are assumed to be similar, thus the SOER of collection tank is adopted for retention tank.

[5] Refer to layout plant by AFCD for Farm 4, there is collection tank to store waste before treatment but no sludge holding tank. It is anticipated that waste storage area is to store waste after treatment, thus the SOER of sludge storage tank is adopted for waste storage area.

								Total Odour Emission	28557.72		

Remarks:

[1] Emission Rate of chicken house and SOER of conveyor belt and rubbish bin refer to the Working Paper on Odour Sampling Results and Odour Emission Inventory – Chicken Farm LK 1172 (Revision 2) dated 17 December 2021 which has been approved by EPD.

[2] Areas of the odour sources referenced to the farm layout plan provided by AFCD.

[3] The odour emission inside each chicken house is discharged to the atmosphere via the exhaust fans. Hence, instead of taking samples on sources to determine the odour emission strength, gas samples were collected inside each chicken house to determine the odour concentrations.

[4] No SOER / emission rate of retention tank, septic tank and filtration tank in the chicken farm was determined in the odour survey from the referenced Working Paper. SOERs of relevant facilities in the pig farms are not applicable because pig farm usually has stronger odour. Thus, odour emission from these facilities are not considered in this comparison assessment between "With Project" and "Without Project" scenarios as a conservative approach.

Remark

[1] Chicken Farm 6 falls outside the 500m assessment area of STLMC DN. Chicken Farm 9 is lack of on-site odour survey data and the SOERs derived from odour sampling in Chicken Farm 5 were not applicable. They are not included in the comparative assessment as a conservative approach.

[2] The unit of odour emission rate for area source is OU/m²·s, and for horizontal point source it is OU/s.

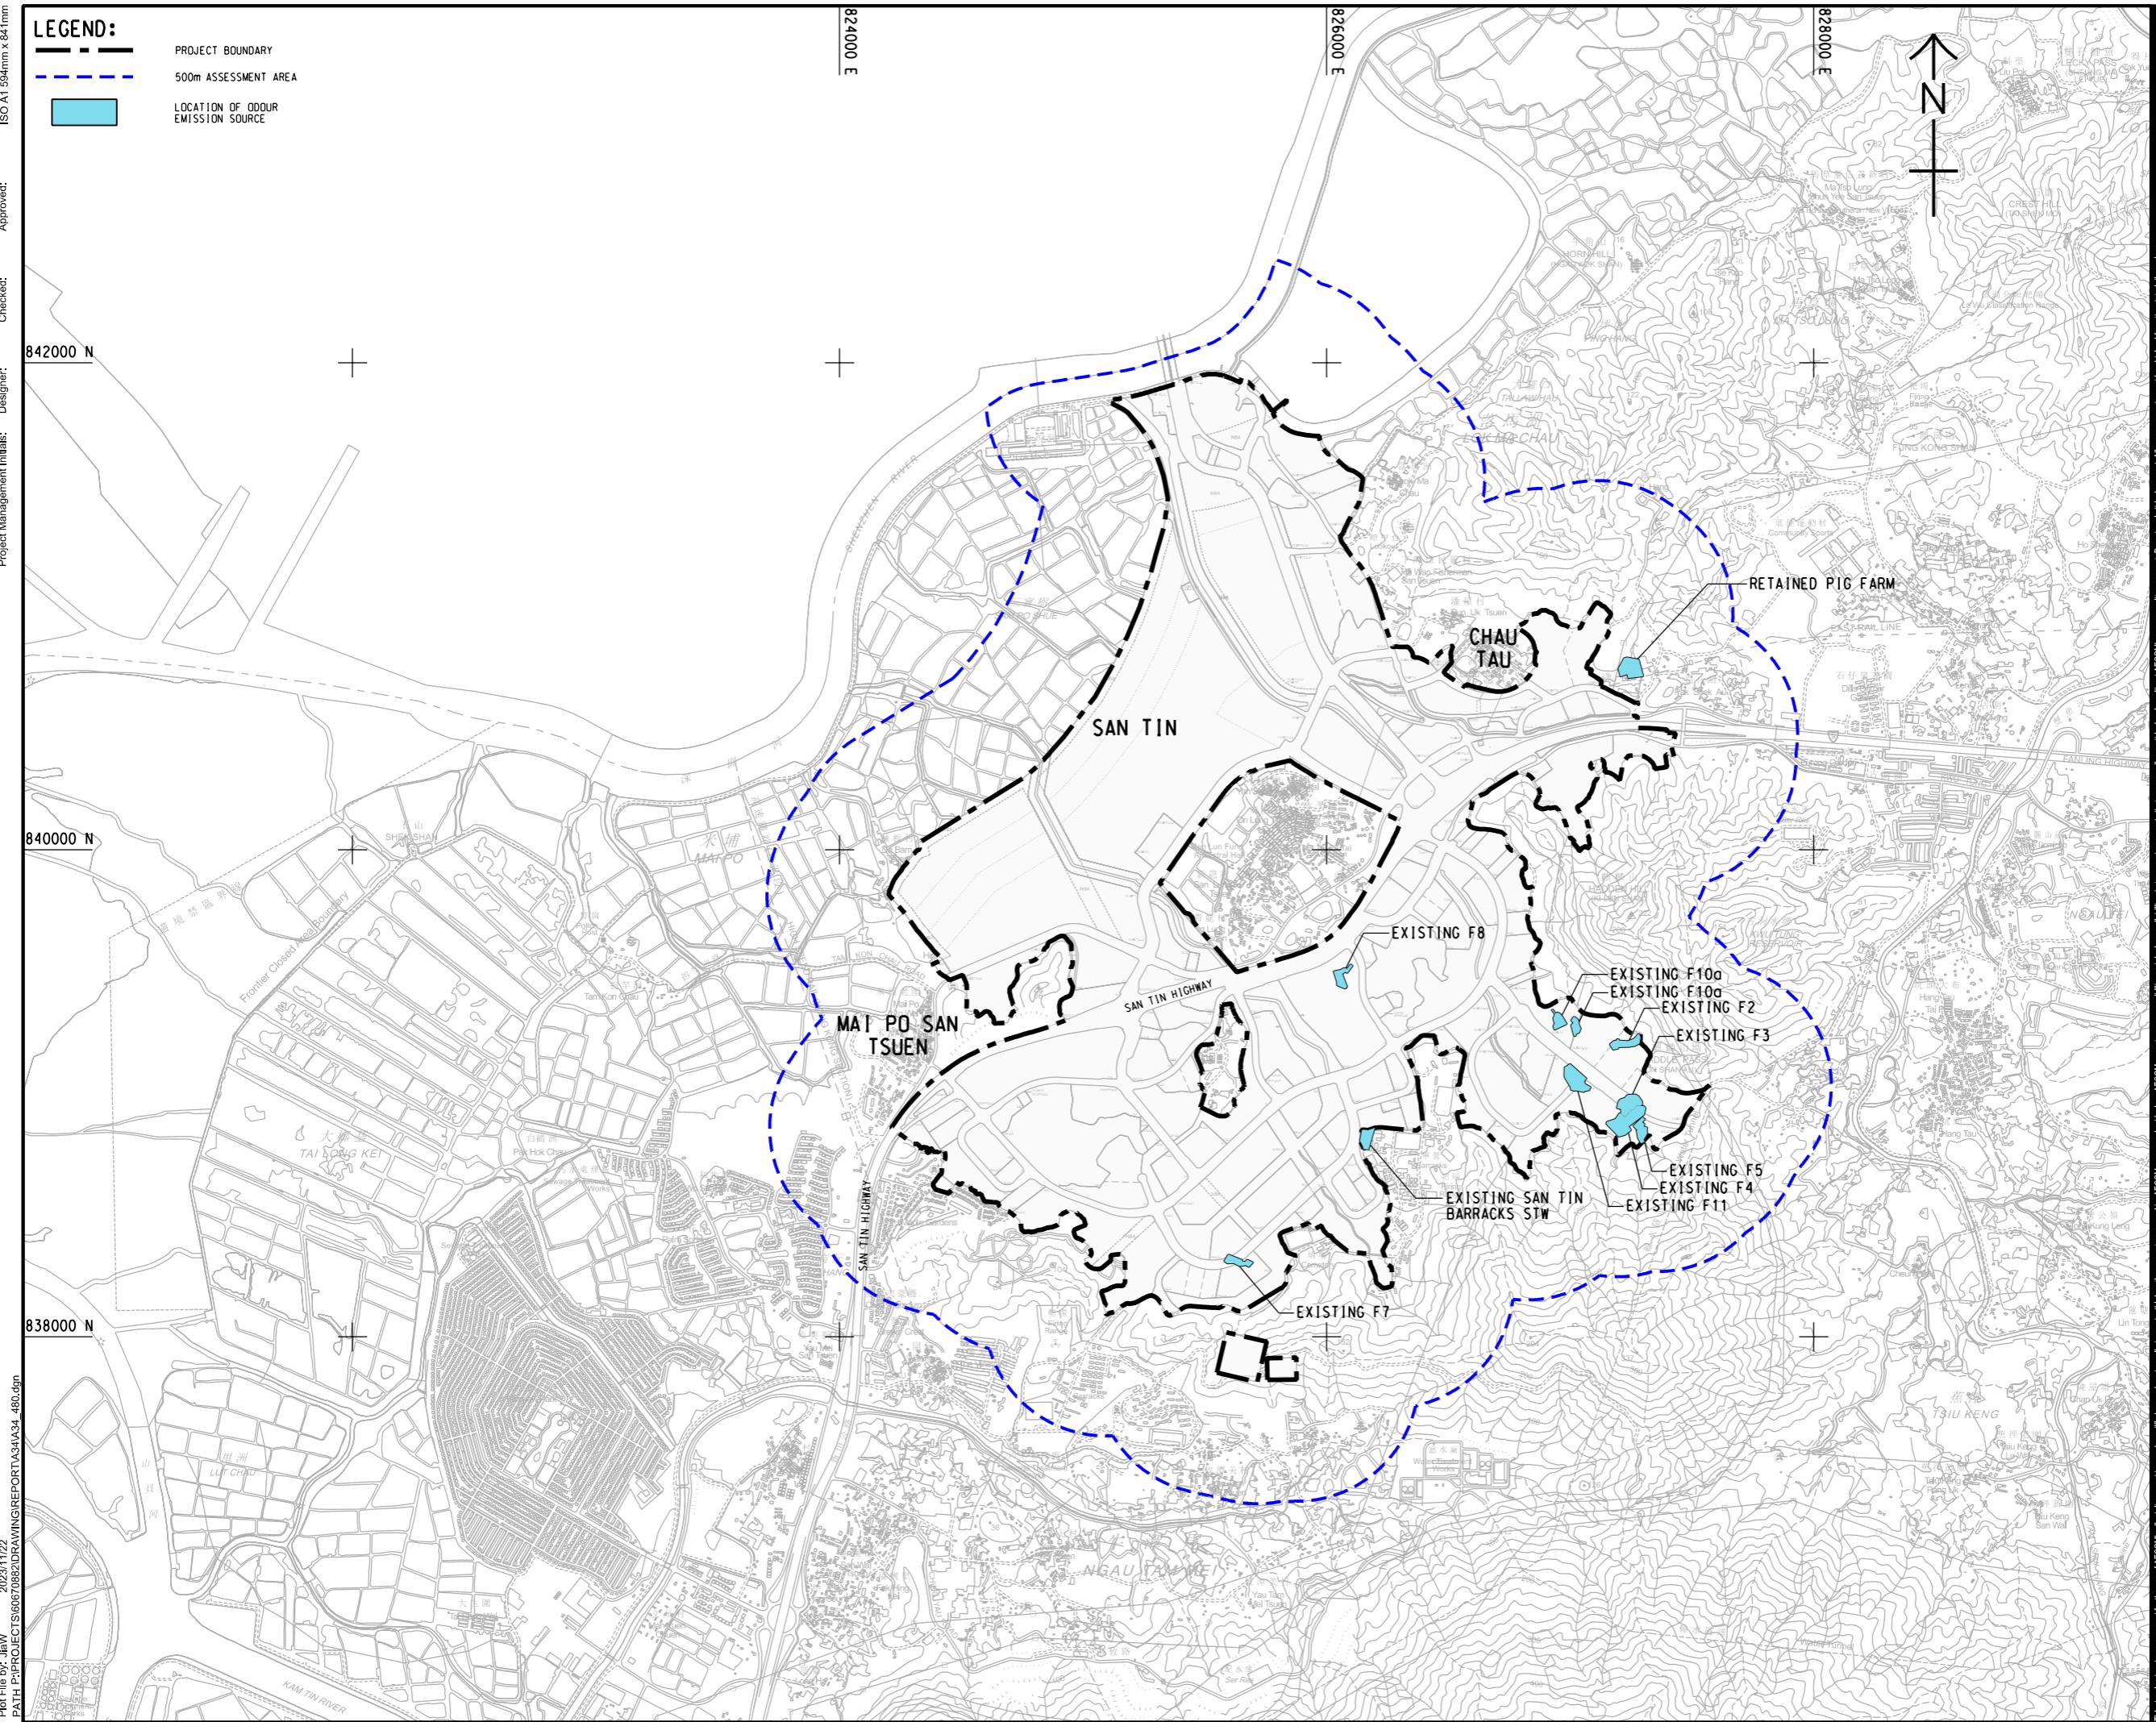

[3] For this comparative assessment, the estimated 1-hour Average Emission Rate (OU/m²·s) of a Pig Farm (F2, F3, F4, F7, F8, F10, F11) = Total Odour Emission Rate from a Pig Farm (OU/s) / Estimated Area of Corresponding Pig Farm (m²).

Appendix B Odour Emission Inventory of Future Scenario

Proposed Food Waste Pre-treatment Facility

Exhaust Design

Deodouriser	Description	Source Type	Exhaust Location		Exhaust Diameter (m)	Height (mAG)	Exit Temperature (K)	Exit Velocity (m/s)
			X	Y				
FWPF1a	Exhaust point	POINT	824662.37	839134.79	0.80	10.00	Ambient	6.6
FWPF1b	Exhaust point	POINT	824662.37	839134.79	0.80	10.00	Ambient	6.6
FWPF2a	Exhaust point	POINT	824580.35	839099.98	0.80	10.00	Ambient	6.6
FWPF2b	Exhaust point	POINT	824580.35	839099.98	0.80	10.00	Ambient	6.6

Remark:

1. Two units of food waste pre-treatment facility (50 tpd each) of the Food Waste / Sludge Anaerobic Co-Digestion Tai Po Pilot Plant is employed to account for the proposed capacity of 100 tpd.
2. The exhaust parameters are provided by engineer.

Conversion of 1-hour Average to 5-second Average Concentration

Deodouriser	Emission Rate (OU/s)	Stability Class	Conversion Multiplier	Emission Rate with 5-second Peak Factor (OU/s)	Reference
FWPF1a	637	A, B, C, D, E, F	2.3	1464.67	<ul style="list-style-type: none"> - Approved Methods for the Modelling and Assessment of Air Pollutants in New South Wales. - Kestone Scientific 1995, The Evaluation of Peak-to-Mean Ratios for Odour Assessments, volumes I and II, Kestone Scientific Pty Ltd, Brisbane. - Kestone Scientific 1998, Peak-to-Mean Concentration Ratios for Odour Assessments, Kestone Scientific Pty Ltd, Brisbane.
FWPF1b	152	A, B, C, D, E, F	2.3	348.55

FWPF2b	POINT	824580.35	839099.98	0.80	10.00	Ambient	6.63	348.55

Remark:

1. For the source of information, refer to San Tin / Lok Ma Chau Development Node EIA Report - Appendix 3.10.

Appendix B Odour Emission Inventory of Future Scenario

Proposed Sewage Pumping Station (OU.1.2, OU.3.2, OU.5.7)

Design of Sewage Pumping Station

Location	Total Odour Emission Area (m ²) ¹	SOER (ou/m ² .s)	Unmitigated Odour Emission Rate (ou/s)	Removal Efficiency (%)	Mitigated Odour Emission Rate (ou/s)
SPS at OU.5.7	954.00	3.26	3110.04	95	155.502
SPS at OU.3.2	563.50	3.26	1837.01	95	91.8505
SPS at OU.1.2	322.50	3.26	1051.35	95	52.5675

Remark:

1. The area of wet well is provided by design engineer.
2. SOER of the inlet well / wet well of the Proposed EPP is adopted to represent the raw sewage.

Exhaust Design

Deodouriser	Description	Source Type	Exhaust Location		Exhaust Diameter (m)	Height (mAG)	Exit Temperature (K)	Exit Velocity (m/s)
			X	Y				
SPS1	Exhaust point of SPS at Site OU.5.7	POINTHOR	825509.39	839378.40	2.00	4.35	Ambient	5.0
SPS2	Exhaust point of SPS at Site OU.3.2	POINTHOR	826578.39	840033.99	2.00	4.35	Ambient	5.0
SPS3	Exhaust point of SPS at Site OU.1.2	POINTHOR	825472.87	841653.66	2.00	4.35	Ambient	5.0

Remark:

1. The exhaust parameters are provided by engineer.

Conversion of 1-hour Average to 5-second Average Concentration

Deodouriser	Emission Rate (OU/s)	Stability Class	Conversion Multiplier	Emission Rate with 5-second Peak Factor (OU/s)	Reference
SPS1	156	A, B, C, D, E, F	2.3	357.65	- Approved Methods for the Modelling and Assessment of Air Pollutants in New South Wales. - Kestone Scientific 1995, The Evaluation of Peak-to-Mean Ratios for Odour Assessments, volumes I and II, Kestone Scientific Pty Ltd, Brisbane.
SPS2	92	A, B, C, D, E, F	2.3	211.26	- Kestone Scientific 1998, Peak-to-Mean Concentration Ratios for Odour Assessments, Kestone Scientific Pty Ltd, Brisbane.
SPS3	53	A, B, C, D, E, F	2.3	120.91	

Emission Source Listing in AERMOD

Source ID	Type	X	Y	Exhaust Diameter (m)	Height (mAG)	Exit Temperature (K)	Exit Velocity(m/s)	Emission Rate with 5-second Peak Factor (OU/s)
SPS1	POINTHOR	825509.39	839378.40	2.00	4.35	Ambient	5.00	357.65
SPS2	POINTHOR	826578.39	840033.99	2.00	4.35	Ambient	5.00	211.26
SPS3	POINTHOR	825472.87	841653.66	2.00	4.35	Ambient	5.00	120.91

Remark:

1. For the source of information, refer to San Tin / Lok Ma Chau Development Node EIA Report - Appendix 3.10.

Appendix B Odour Emission Inventory of Future Scenario

Proposed Refuse Transfer Station

H₂S and NH₃ Monitoring data at WKTS

Maximum Total Odour Emission at DO Inlets (OU/s)	Odour Contribution by H ₂ S (OU/s)	Odour contribution by NH ₃ (OU/s)
485532.85	482360.83	3172.01

Remark:

Based on the monitoring data recorded from Jan 2021 to May 2022 in West Kowloon Refuse Transfer Station (WKTS) and it covers the odour from the wastewater treatment plant.

Odour threshold of H₂S = 0.00047 ppm

Odour threshold of NH₃ = 0.037 ppm

MSW Handling Capacity of Proposed RTS (tpd)	MSW Handling Capacity of WKTS (tpd)	Odour Emission Adjustment factor
3000	2700	1.11

Estimation of Odour Emission from Proposed RTS

	Emission Rate (OU/s)	Adjustment factor	Removal Efficiency	Controlled Odour Emission (OU/s)
Odour by H ₂ S	482360.83	1.11	99.90%	535.96
Odour by NH ₃	3172.01	1.11	90.00%	352.45
Total odour emission (OU/s)				888.40

Remark:

Two stage deodorisation system with 99.9% and 90% removal efficiency for H₂S and NH₃ are adopted for the proposed RTS.

Continuous monitoring of actual H₂S and NH₃ concentrations after commissioning is required.

The odour emission rate is the total emission rate to be evenly distributed among the six deodorizing units RTS_DO1-RTS_DO6 below.

Exhaust Points of Waste Transfer Building

Deodouriser	Description	Source Type	Exhaust Location		Exhaust Diameter (m)	Height (mAG)	Exit Temperature (K)	Exit Velocity (m/s)
			X	Y				
RTS_DO1	Exhaust point	POINT	827349.99	840396.11	1.20	41.41	Ambient	15.0
RTS_DO2	Exhaust point	POINT	827332.42	840401.79	1.20	41.41	Ambient	15.0
RTS_DO3	Exhaust point	POINT	827314.86	840407.48	1.20	41.41	Ambient	15.0
RTS_DO4	Exhaust point	POINT	827297.30	840413.16	1.20	41.41	Ambient	15.0
RTS_DO5	Exhaust point	POINT	827279.74	840418.85	1.20	41.41	Ambient	15.0
RTS_DO6	Exhaust point	POINT	827262.17	840424.53	1.20	41.41	Ambient	15.0

Remark:

The exhaust parameters refers to the expansion of WKTS with 3,182 tpd in Refurbishment and Upgrading Studies for (A) West Kowloon Transfer Station and (B) Island West and Island East Transfer Stations

Conversion of 1-hour Average to 5-second Average Concentration

Deodouriser	Emission Rate (OU/s)	Stability Class	Conversion Multiplier	Emission Rate with 5-second Peak Factor (OU/s)	Reference
RTS_DO1	148	A, B, C, D, E, F	2.3	340.55	<ul style="list-style-type: none"> - Approved Methods for the Modelling and Assessment of Air Pollutants in New South Wales. - Katestone Scientific 1995, The Evaluation of Peak-to-Mean Ratios for Odour Assessments, volumes I and II, Katestone Scientific Pty Ltd, Brisbane. - Katestone Scientific 1998, Peak-to-Mean Concentration Ratios for Odour Assessments, Katestone Scientific Pty Ltd, Brisbane.
RTS_DO2	148	A, B, C, D, E, F	2.3	340.55	
RTS_DO3	148	A, B, C, D, E, F	2.3	340.55	
RTS_DO4	148	A, B, C, D, E, F	2.3	340.55	
RTS_DO5	148	A, B, C, D, E, F	2.3	340.55	
RTS_DO6	148	A, B, C, D, E, F	2.3	340.55	

Remark:

6-stack configuration is assumed for the proposed RTS, with reference to the expansion of WKTS with 3,182 tpd in Refurbishment and Upgrading Studies for (A) West Kowloon Transfer Station and (B) Island West and Island East Transfer Stations.

Appendix C

Modelling Approach

Appendix C Modelling Approach

With reference to Clause 3.4.3 and Appendices B and B-1 of the EIA Study Brief ESB-340/2021 and EPD's Guidelines for Local-Scale Air Quality Assessment Using Models, American Meteorological Society (AMS) and U.S. Environmental Protection Agency (EPA) Regulatory Model (AERMOD), the HKEPD approved air dispersion model, was employed to predict the odour impact at representative ASRs.

Cumulative odour impact within 500m from these odour sources, namely the proposed EPP, RTS and FWPF, proposed SPSs, Retained Pig Farm and San Tin Barracks STW, were assessed. It is assumed that the proposed deodorizing units/system of the proposed EPP and the proposed RTS operate continuously on a 24-hour-per-day basis with steady state ventilation rate and exhaust gas velocity in the assessment, unless otherwise specified. Odour emission from the exhaust outlet of the deodorizers was modelled as point source, while odour emission from the retained pig farm was modelled as volume and area sources for pig houses and tank surfaces respectively. Odour emission inventory in detail is shown in **Appendix B**.

Hourly meteorological conditions including wind data, temperature, relative humidity, pressure, cloud cover and mixing height of Year 2015 were extracted from the WRF meteorological data adopted in the PATHv2.1 system. The dataset by WRF should be intact and consistent among parameters. In order to avoid any hours misidentified as missing data by AERMOD and its associated components, the WRF met data were handled manually to set wind direction between $0^\circ - 0.1^\circ$ to be 360° . The height of the input data was assumed to be 9 metres above ground for the first layer of the WRF data as input.

The wind speed and mixing heights in the WRF data were further adjusted before meteorological pre-processing by AERMET. The minimum wind speed was capped at 1 metre per second. The mixing height was capped between 131 metres and 1941 metres according to the observation in Year 2015 by HKO. After pre-processed by AERMET, the mixing height was verified once again and adjusted to the capped range if necessary.

Surface characteristic parameters such as albedo, Bowen ratio and surface roughness are required in the AERMET. The parameters are determined according to land use classified for the surrounding and the latest AERMOD Implementation Guide. Flat terrain was applied in AERMOD.

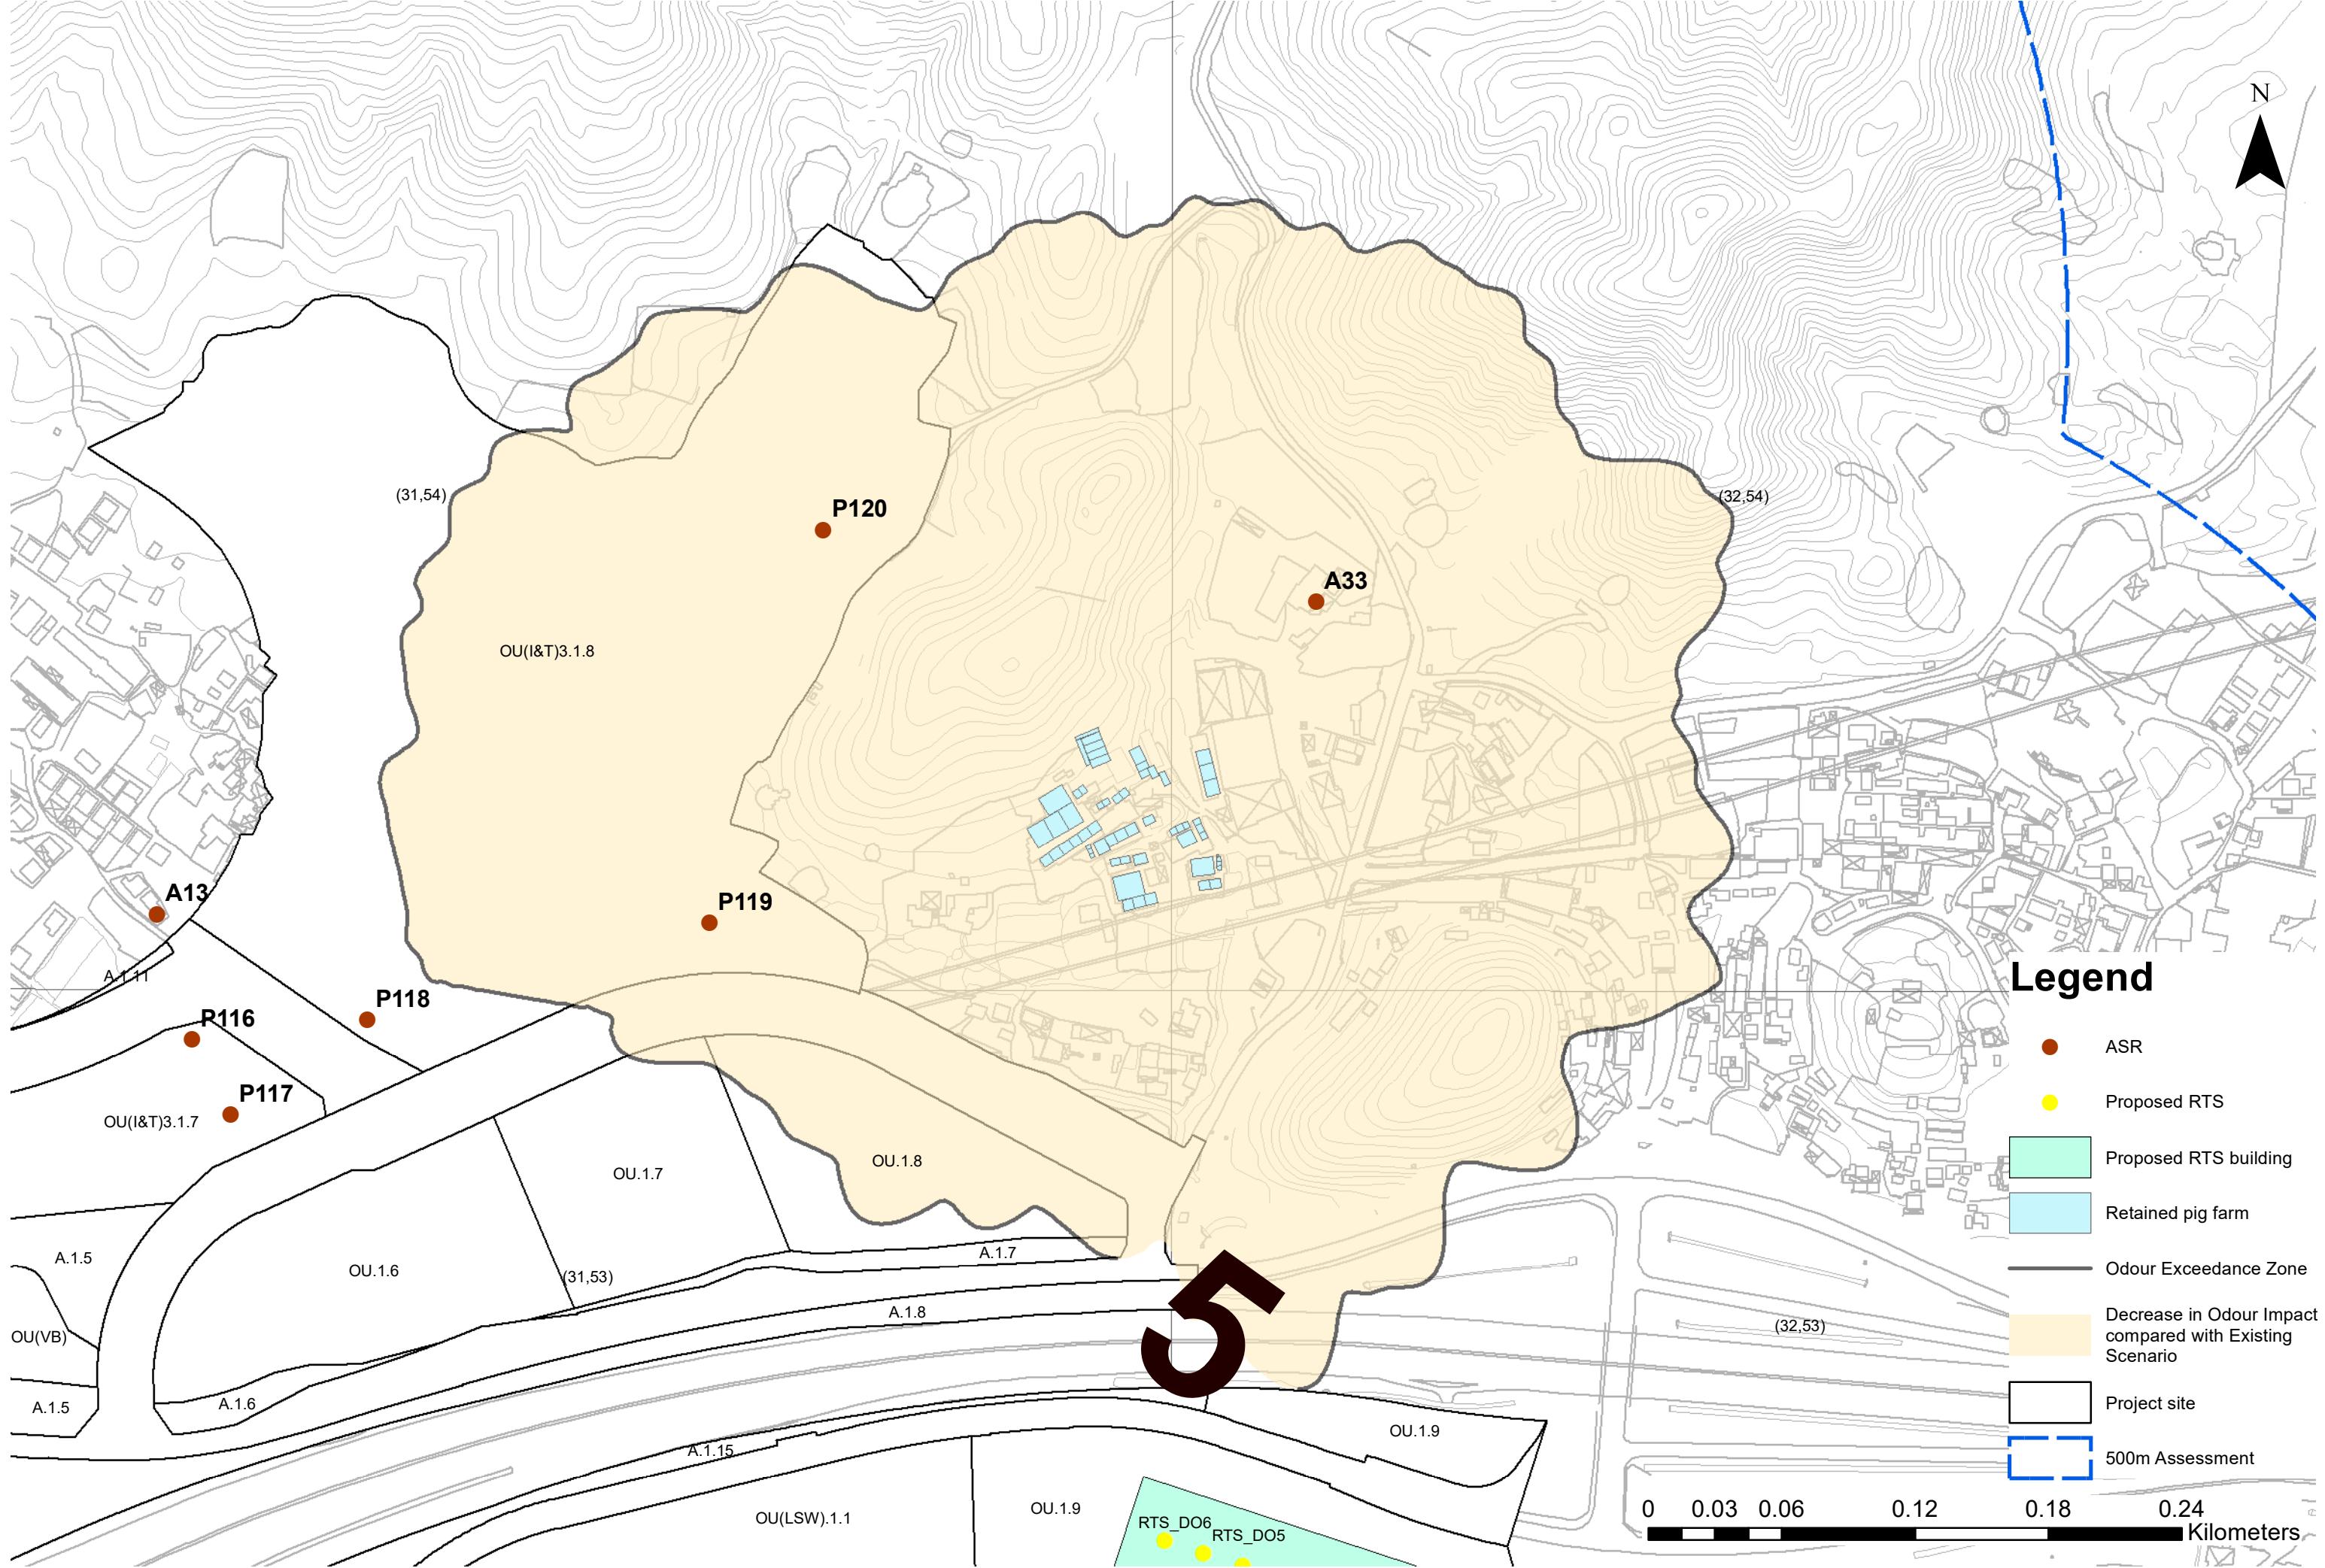

If the odour emission sources are found to be wake-affected point sources, the 1-hour to 1-second conversion factors from Approved Methods for the Modelling and Assessment of Air Pollutants in New South Wales (NSW Approved Method) for wake-affected point sources would then be adopted. The conversion factors for wake-affected point sources converting 1-hour average to 1-second average concentration stipulated in NSW Approved Method would be adopted directly to convert the 1-hour concentration predicted by the AERMOD model to 5-second concentration as a conservative approach. The conversion factors for different types of source and stability classes are listed in **Table C.1**. Pasquill-Gifford stability refers to the dataset based on the WRF meteorological data.

Table C.1 Conversion Factors to 5-second Mean Concentration

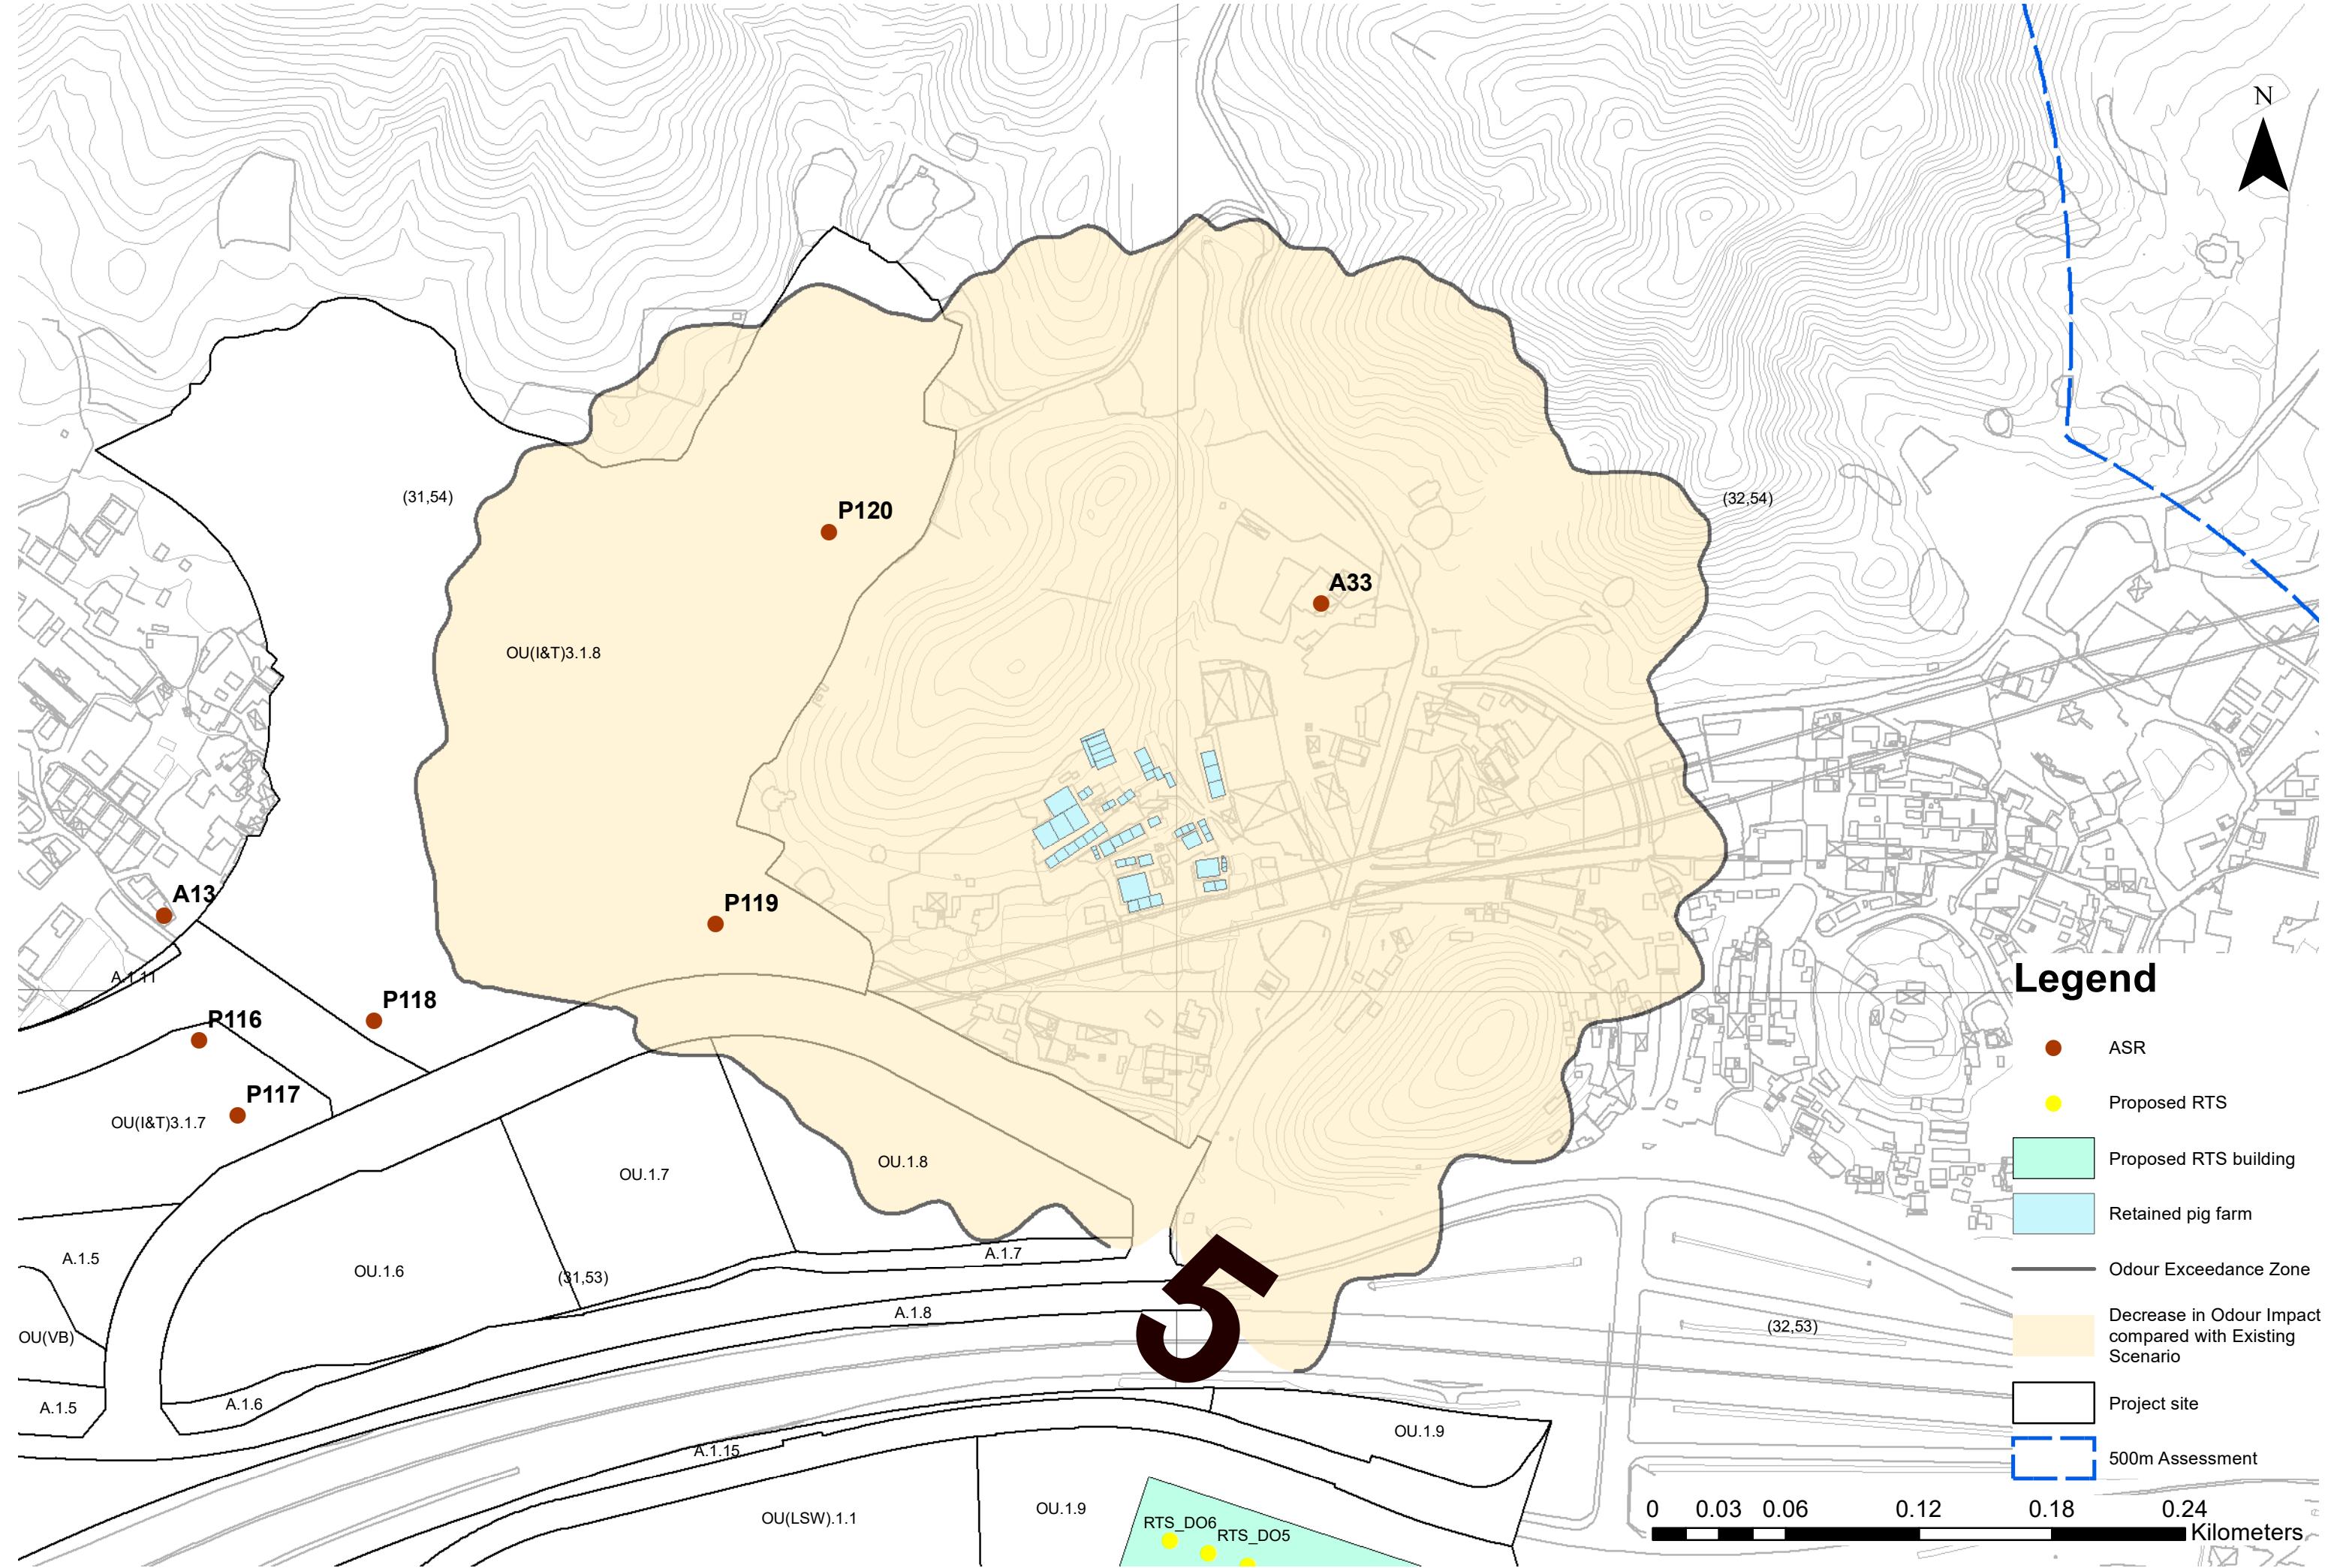

Pasquill Stability Class	Conversion Factor	
	Wake Affected Point Source / Volume Source	Area
A	2.3	2.5
B	2.3	2.5
C	2.3	2.5
D	2.3	2.5
E	2.3	2.3
F	2.3	2.3
