

Pearl River Delta
Regional Air Quality Monitoring Network

July to September 2014

**Statistical Summary of the Third Quarter
Monitoring Results**

Report Number : **PRDAIR-2014-3**

Report Prepared by : **Guangdong Provincial
Environmental Monitoring
Centre**

**Environmental Protection
Department, HKSAR**

Approved by : **Pearl River Delta Air Quality
Management and Monitoring
Special Panel**

Security Classification : **Unrestricted**

1. Foreword

Since the Pearl River Delta (PRD) Regional Air Quality Monitoring Network (the Network) came into operation on 30 November 2005, it has been reporting PRD Regional Air Quality Index (RAQI) to the public on daily basis. Starting from 2006, a half-yearly and an annual air quality monitoring reports were published every year.

In view of the needs of air pollution control and economic development of the region, the environmental protection departments of Guangdong and Hong Kong have worked in collaboration with the environmental protection cum meteorological authority of Macao to enhance the existing Network by extending the coverage of monitoring area to the 3 places, i.e. Guangdong, Hong Kong and Macao, in September 2014. The enhancement include the increase of number of monitoring station from 16 to 23 to further improve the spatial distribution; and the addition of two more monitoring parameters, i.e. carbon monoxide (CO) and fine suspended particulates (PM_{2.5}), to enrich the air quality monitoring information.

In conjunction with the enhancement of the Network and the update of ambient air quality standards, starting from 2014, we report real time monitoring data of the Network on hourly basis through a new internet platform and publish a quarterly air quality monitoring report every quarter and an annual monitoring report in a year to increase the reporting frequency of monitoring results. The quarterly report is mainly a brief statistical summary of the monitoring results of the regional air quality in a quarter while the annual report, in addition to the reporting of the relevant data, will provide a more detailed analysis and comparison of the condition of air quality in the year.

This is the third report published in the form of quarterly report, i.e. Statistical Summary of the 2014 Third Quarter Monitoring Results of PRD Regional Air Quality Monitoring Network. With the enhancement of the Network, the report will be renamed “Guangdong-Hong Kong-Macao Pearl River Delta Regional Air Monitoring Network” starting from the upcoming fourth-quarter report. The coverage of report will be expanded to cover the newly added monitoring stations making up to 23 stations in total and to include the two newly added monitoring parameters of carbon monoxide (CO) and fine suspended particulates (PM_{2.5}).

2. Introduction to the Pearl River Delta Regional Air Quality Monitoring Network

The Pearl River Delta (PRD) Regional Air Quality Monitoring Network was jointly established by the Guangdong Provincial Environmental Monitoring Centre (GDEMC) and the Environmental Protection Department of the Hong Kong Special Administrative Region (HKEPD) from 2003 to 2005. The Network came into operation on 30 November 2005 and its data have been used for reporting Regional Air Quality Index (RAQI) to the public since then.

The Network comprises 16 automatic air quality monitoring stations (see Figure 2.1) across the PRD region. Ten of these stations are operated by the Environmental Monitoring Centres of the individual cities in Guangdong while the three stations located in Hong Kong are managed by the HKEPD. The remaining three regional stations in the Network are operated by the GDEMC.

All stations are installed with equipment to measure the ambient concentrations of respirable suspended particulates (PM₁₀ or RSP), sulphur dioxide (SO₂), nitrogen dioxide (NO₂) and ozone (O₃).

Annexes A and B set out, respectively, the site information of the monitoring stations in the Network and the methods used for measuring air pollutant concentrations.

Figure 2.1 : Spatial distribution of the PRD Regional Air Quality Monitoring Stations

3. Operation of the Network

Owing to the extensive renovation work at the Wanqingsha monitoring station in Guangzhou Nansha, the station was suspended from operation most of the time in the reporting period of the third quarter 2014.

The operation of the Network was generally smooth in the reporting period. Excluding the almost suspended Wanqingsha station, the average data capture rates of all other monitoring stations in the Network was 95%.

4. Statistical Analysis of Pollutant Concentrations

Table 4.1a to Table 4.4b list the statistical summaries of monitoring results of the ambient concentrations of the four air pollutants (sulphur dioxide (SO₂), nitrogen dioxide (NO₂), ozone (O₃) and particulate matter PM₁₀) during the reporting period in July to September 2014, and their brief comparisons with the short-term air quality indicators of the latest national "Ambient Air Quality Standards" (NAAQS) (GB3095-2012).
